available for animal nutrition, an alternative has been found in the plant *Solanum glaucophyllum* which contains the active form of Vitamin D3 in glycosidically bound form. In order to exploit this plant as a source of active vitamin D, a unique standardized and formulated herbal product for animal nutrition containing 1,25(OH)2 D3-glycosides as active components was developed. This affords better pharmacokinetic properties and turns the product into a slow release form with little danger of overdosing.

**Plasma concentration of 1,25(OH)2D3 after a single dose of 1,25(OH)2D3-glycosides or synthetic 1,25(OH)2D3 in rats (S120234)**

**Sainfoin – new data on anthelmintic effects and production in sheep and goats**

Heckendorf F, Werne S, Maurer V, Pertier E, Amstler Z, Prüfer C, Egg C, Kronenberg I

Research Institute of Organic Agriculture, P.O. 800, 5070 Frick, Switzerland

Gastrointestinal nematodes (GIN) are one of the most important problems affecting health and therefore performance and welfare in small ruminant husbandry. The control of these parasites in the past strongly relied on the repeated use of anthelmintic drugs. This has led to nematode populations which are resistant to most of the currently available anthelmintics. Furthermore customer's demands for organic and residue free animal products are increasing. The aforementioned problems have given a strong impetus for the development of new non-chemical strategies to control GIN. Previous research has pointed out the anthelmintic potential of sainfoin ( *_Melilotus viridis* , cv. *Visnivska* ) and other tanniferous (CT) feed sources in goats and lambs infected with GIN. A recent Swiss experiment focused on the use of sainfoin and field bean ( *Vicia faba* , cv. *Scirocco*) as single CT sources as well as in combination for additional synergic effects, to reduce periparturient GIN egg rise of ewes in late gestation and early lactation. Another experiment with Alpine goats concentrated on the influence of sainfoin on milk performance and cheese quality. The results of these experiments will be presented and discussed in connection with previous knowledge on (i) anthelmintic effects of sainfoin and (ii) the influence of sainfoin administration on performance.

**Effective plant reproduction of *Pelargonium sidoides* by using somatic embryogenesis**

Duchow S, Bitschek W, Claessen B

Pharmaceutical Institute, Dept of Pharmaceutical Biology, University of Riel, Gutenbergstraße 76, 42118 Kiel, Germany

Roots of the native South African medicinal plant *Pelargonium sidoides* DC are used for the production of the herbal medicinal product Umckaloabo® which is approved for the treatment of acute bronchitis. Initially, the plant material only originated from wild collections. Since some years the root material increasingly is derived from plant agriculture of *P. sidoides*. Nevertheless the population of wild growing plants during the last years decreased by half. With regard to species protection in combination with an increasing demand of plant material for the industrial production of the medicinal product, the requirement of an effective method for the propagation of *P. sidoides* becomes obvious. With somatic embryogenesis, a cell culture technique for plant reproduction, embryos could be generated from somatic cells of blossoms of *Pelargonium*. A one-week cultivation of the plant explants in media containing specific phytohormones followed by a cultivation period without phytohormones resulted in the induction of numerous somatic embryos within 3–4 weeks. A treatment of explants with a specific purified extract leads to improved somatic embryogenesis. The method allows an enhanced production of numerous clones from one plant (e.g. interesting chemical races) and represents an effective way of plant reproduction. Reference: [1] Newton, D. (2008): Development of a non-definitive finding process for *Pelargonium sidoides* in Lesotho. Internat. Expert Workshop on CFTE Non-Definitive Findings. Cancun, Mexico, 2008.

**Anti-viral and anti-inflammatory efficacies of Snupret® dry extract BNO 1011 rationalise its therapeutic use in acute rhinosinusitis**

Wierz O1, Sejert S2, Wociskowski K2, Haushcl H2

1Friedrich-Schiller University, Chair of Pharmacoeconomics; 2School of Pharmacy; 3Department of Clinical Research, University of Heidelberg, Germany; 4Biotechnologie SE, Preclinical & Project Management, IGEZ, Neumarkt (52219), Germany

The herbal medicinal product Snupret® (Gentianae radix, Primulas fl., Scrophulariae flos, Sambuci herba) is used for the treatment of acute rhinosinusitis. Its pathophysiologically is dominated by inflammation in nasal/paranasal mucosa, mainly triggered by infection with respiratory viruses like human influenza A. We investigated the anti-viral and anti-inflammatory activity of Snupret® dry extract BNO 1011 (in vitro and in vivo, BNO 1011 was tested against two human influenza A H1N1 (Flu A) strains with divergent sensitivity against the neuraminidase inhibitor oseltamivir (OS) in a plaque reduction test and for neuraminidase inhibition of the same Flu A strains. The anti-inflammatory activity of BNO 1011 was evaluated by monitoring the dilpencyclicyclhydralazine (DPhP) radical scavenging activity in the carrageenan-induced pleurisy model in rats, BNO 1011 (100 mg/kg and 500 mg/kg, p.o.) was analyzed for suppression of pro-inflammatory parameters [edematous formation, neutrophil infiltration, prostaglandin E2 (PGE2)], levels: pulmonary cyclo-oxygenase (COX-2)]. BNO 1011 blocked Flu A replication with an EC50 of 8 μg/ml for each strain tested. As underlying mechanism, neuraminidase inhibition was identified (IC50: 59 μg/ml and 100 μg/ml, respectively), irrespective of the strains' sensitivity against oseltamivir. Regarding the anti-inflammatory activity, BNO 1011 reduced the DPhP radical concentration (IC50: 46 μg/ml) in vitro. Moreover, orally applied BNO 1011 significantly reduced edematous volume, neutrophil influx (100 and 500 mg/kg), PGE2 levels and COX-2 expression (500 mg/kg) in acute pleurisy. Together, BNO 1011 acted against the cause of respiratory viral infection and interfered with the inflammatory collateral damage. These findings support the application of BNO 1011 in the treatment of acute viral rhinosinusitis.

**Calcium antagonistic effects of ethanolic myrrh extract in inflamed intestinal smooth muscle preparations**

Visselhoven C1, Goes K2, Goes O2, Nieber K1

1University of Leipzig/Institute of Pharmacy; 2REPHA GmbH Biologische Arzneimittel

Myrrh is the oleo-gum resin of mainly *Commiphora molmol* ENGELR (Burseraceae) and as powdered substance one compound in the traditional medicinal product Myrrhin-INTEST®, which has been used for the treatment of unspacific and inflammatory intestinal disorders. To date only limited data is available regarding its mode of action. Besides antymycotic and antipathogenic properties calcium antagonistic and antiadhesive effects have been discussed [1]. The aim of the present study was to evaluate the calcium antagonistic effect of myrrh. Therefore, an ethanolic myrrh extract (ICM) was tested for its effects on muscle tone and acetylcholine (ACH)-induced contractions in untreated and inflamed rat ileumjejenum preparations. Inflammation was experimentally induced by 2,4,6-trinitrobenzenesulfonic acid (TNBS, 10 mM, 30 min). Additionally, the effect of the calcium channel agonist Bay K8644 in presence of varying MV concentrations was examined to con-
