Community supported agriculture in urban settings

A way for better understanding and implementation of sustainability – a Norwegian experience

The Norwegian Centre for Organic Agriculture www.norsok.no

ABSTRACT

Norway covers an abundant wilderness, only 3 % of the land are cultivated. The last ten years the eagerness to form and join Community Supported Agriculture, CSA, has boomed. The initiatives are supported by NGOs and authorities. A literature survey shows what makes the Norwegian experience special and what is common with other urban efforts. The survey focused on sustainability in household and lifestyle. Hypothesis was: that organic agriculture is a way for sustainability and furthermore a goal set by authorities and peoples organizations. Most important conclusions were that CSA indeed makes a step forward to sustainability even though some questions and conflicts of interests may appear.

Community Supported Agriculture, CSA, is:

• "A partnership between farmers and consumers where, at the last, the responsibilities and rewards of farming is shared". CSA implies three different values:
  1) Dialogue, between farmer and consumer
  2) Transparency in economy and
  3) Shared benefits and costs. CSA is practiced in either a consumer- or a farmer-driven model. Furthermore, a characteristic is that members often participate in work on the farm.

INTRODUCTION

Community Supported Agriculture (CSA) in Norway has recently boomed from one single farm in 2006 to more than 50 in 2016 registered by the the organic movement of producers and consumers (OIKOS – Organic Norway, 2016). Please see figure 1. The Norwegian CSAs envolves from 10 to 350 shareholders. Each shareholder prepay between 130 to 380 euro each year and volunteers in the farm work. Geographical distribution is showed in figure 2.

The Scandinavian countries hold rather ambitious national plans for implementation of organic farming. The governments justify this because it can be part of sustainable development. The national Action Plan in Norway is aiming for 15% organic production and consumption in 2020. The big number of CSAs in Norway, all organic, is exceptional; Denmark counts for one, Finland for eight and Sweden for a dozen CSAs (Roisin, 2016).

RESULTS

CSAs in Europe initiated in Switzerland 35 years ago, spread to a few other countries and took off in the new millennium. It exist in 21 countries at the moment. France counts for 2000, Belgium for 138 and Italy for 104 CSAs (Roisin, 2016). Comparing the Norwegian experience to that of others firstly, one may list what is special in the Norwegian case:

• The engagement of NGOs to be leading actors is unique compared to other countries.
• The CSA-concept would only be a success in peri-urban areas. It is not an option in remoted farms.
• Social sustainable because it give upcoming generation competence and understanding in food production and include a wide range of different people living under conditions where cultivation may not be possible.

CONCLUSION

The idea of CSA is ecological sustainable, if some considerations are taken into account and can be done to practice. Often one will see that organic certification is not economic nor administrative reachable. Furthermore farming organically without animals is challenging. Nevertheless all Norwegian CSAs are organic farmed. The CSA-concept would only be a success in peri-urban areas. It is not an option in remoted farms. Protection of agricultural fields is identified as one of five most important issues in urban planning (Leipzig charter, 2007). It is probably more important in the case of Norway. Maybe the interest for CSA also is connected to this awareness and to some degree explains why this is the case in Norway and not in other Scandinavian countries.

LITERATURE CITED

OIKOS-organic Norway,2016: http://www.oikos.no/aktuelt/50-andelslandbruk-i-norge/
SLF,2016: Produksjon og omsetning av økologiske landbruksvarer. Rapport for 138 and Italy for 104 CSAs (Roisin, 2016). Comparing the Norwegian experience to that of others firstly, one may list what is special in the Norwegian case:

• The commercial market for organic products are still limited compared to neighbouring countries, this may encourage consumers to do something actively.
• The area of arable land is limited and mostly located in peri-urban areas.
• The engagement of NGOs to be leading actors is unique compared to other countries.

CONCLUSION

Conclusions states that following is special in the Norwegian experience:

• The area of arable land is limited and mostly located in peri-urban areas.
• The engagement of NGOs to be leading actors is unique compared to other countries.

Furthermore it is stated that the Norwegian experience is sustainable in three aspects considered:

• Ecological sustainable because it implies low input, low contamination and high diversity.
• Economical sustainable because it balances production and consumption.
• Social sustainable because it give upcoming generation competence and understanding in food production and include a wide range of different people living under conditions where cultivation may not be possible.

The Norwegian CSAs are carrying out top goals for sustainability in a humble practical approach from the people.
