Functional agrobiodiversity (FAB) and its management techniques becomes more and more popular in agriculture to obtain sustainable ecosystem services as for example pest management. Perennial crops are very suitable for implementation of sustainable FAB techniques. One aim of the CORE Organic Plus project EcoOrchard is to collect the existing information about FAB and its management techniques to improve and exchange knowledge and practical experience between scientists, advisors and owners of apple orchards. To fulfill this aim many advisors and farmers have been interviewed in 9 European countries including Latvia. As the term FAB is new in Latvia, information regarding its techniques and their use in Latvia were also searched in other sources like existing rules and regulations and extension materials for farmers. We have found that some FAB techniques are already used for pest management in apple orchards in Latvia and that most of them are natural elements in the orchard or implemented because of other aims. Farmers in Latvia do not acknowledge the fact that some techniques they use are FAB related, and they do not evaluate the efficacy of these techniques for FAB. The EcoOrchard project will test methods for FAB assessment with growers, also in Latvia, and provide growers and advisory service in Latvia access to more information and information exchange about FAB.

The authors acknowledge the financial support for the project EcoOrchard provided by transnational funding bodies being partners of the FP7 ERA net project, CORE Organic Plus, and the cofund from the European Commission.

Key words: project EcoOrchard, functional agrobiodiversity, pest management, apple orchards
