

The arable vegetation of Baltic organic cereal fields as shaped by crop management

M.A.J. Hofmeijer, B. Melander, J. Salonen, T. Verwijst, L. Zarina, B. Gerowitt

Objectives

Aim: Better utilization of crop diversification strategies for weed management. To control weed densities and maintain diverse arable weed vegetation that is manageable in the long-term.

Objective: Investigate the role of crop diversification strategies on weed vegetation on farms.

- I. International utilization of crop diversity strategies
- II. What is the influence of crop diversity strategies on:
 - Weed density
 - Weed species numbers
 - Weed diversity
- III. Study the influence of crop diversity strategies on the weed community

Method - Weed survey and explanatory variables

Weed survey

Taking place at organic farms in spring sown cereals, BBCH stage 61-69

Transect of 100m², 3 replications per field, 207 fields in 2015-2016

Estimation of weed species density

Explanatory variables

Collection of field history data

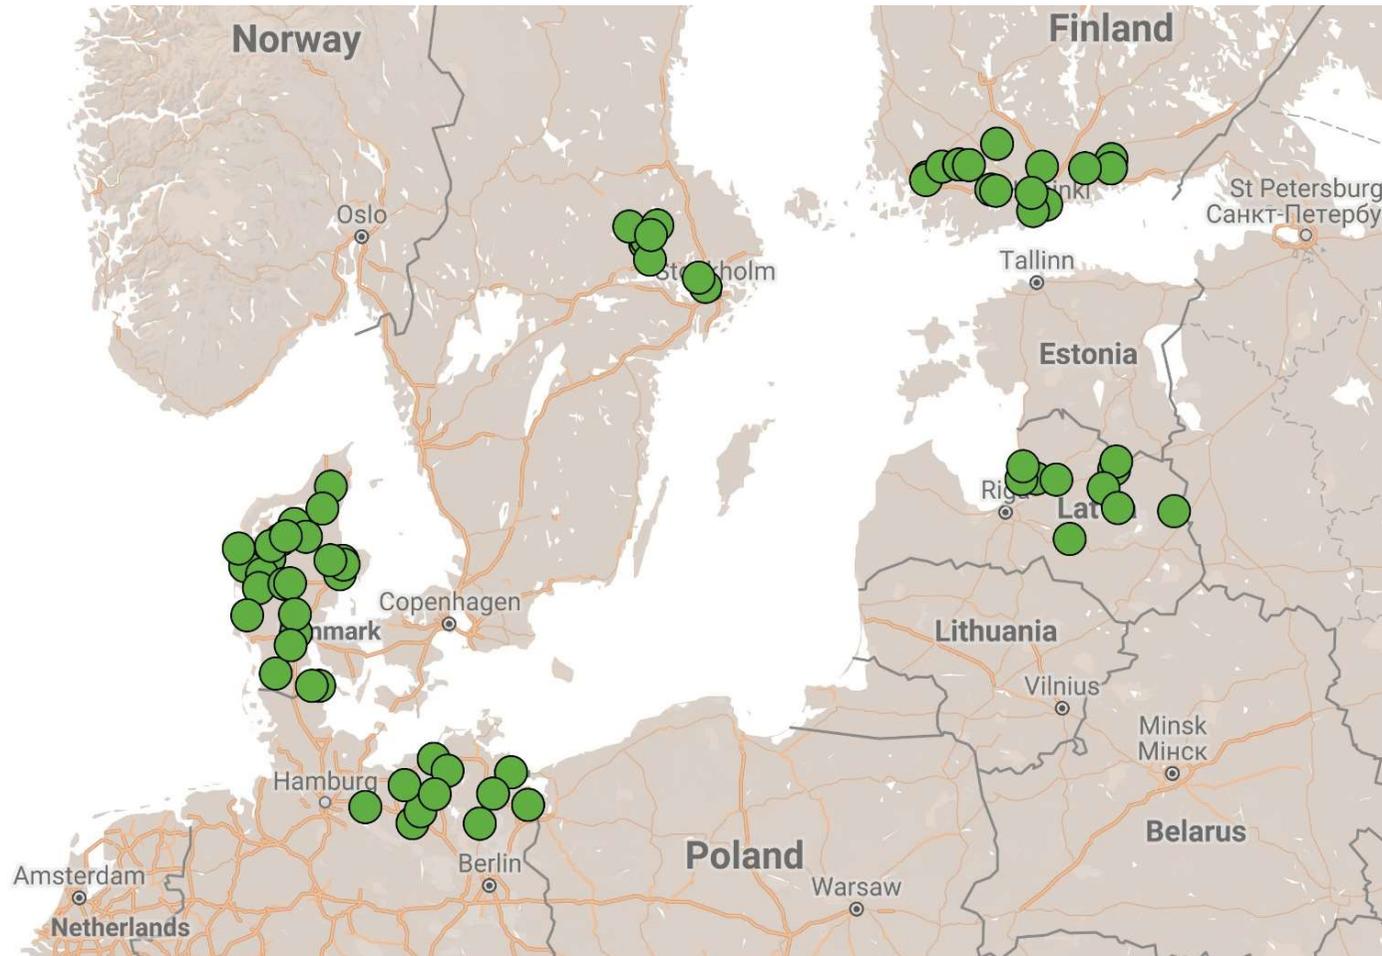

Statistical analysis

Linear mixed models, multivariate analysis,
canonical correspondence analysis (CCA)

Density Classes	100 m ²	m ²
I	0-20	<1
II	20-50	<1
III	50-100	0.5-1
IV	100-200	1-2
V	200-500	2-5
VI	500-1000	5-10
VII	1000-5000	10-50
VIII	5000-10000	50-100
IX	10000-50000	100-500

Method - Site

Definitions

Main crop: Cash crop

- This includes grass clover leys, that are cut

Undersown crop: A cover crop sown at the same time as the main crop, but not harvested as a cash crop.

- In this study mostly grass clover, grass or clover solely, or vetch

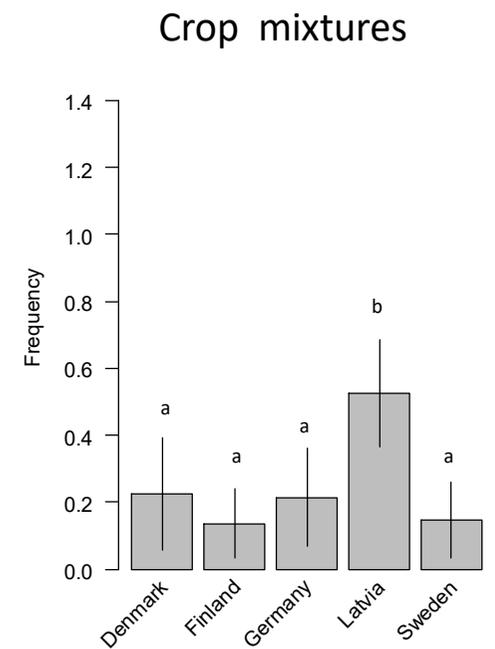

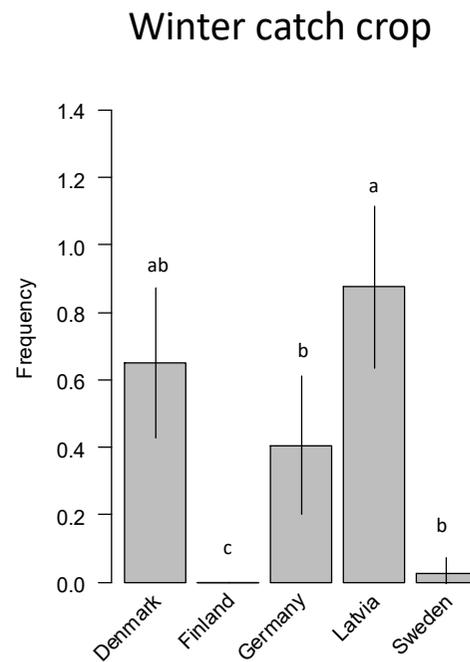

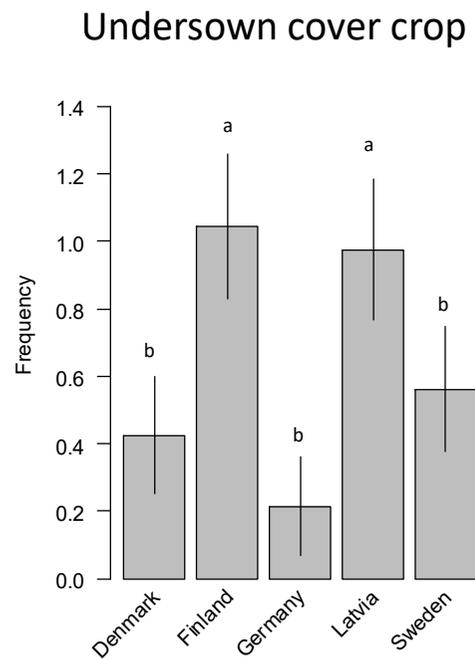

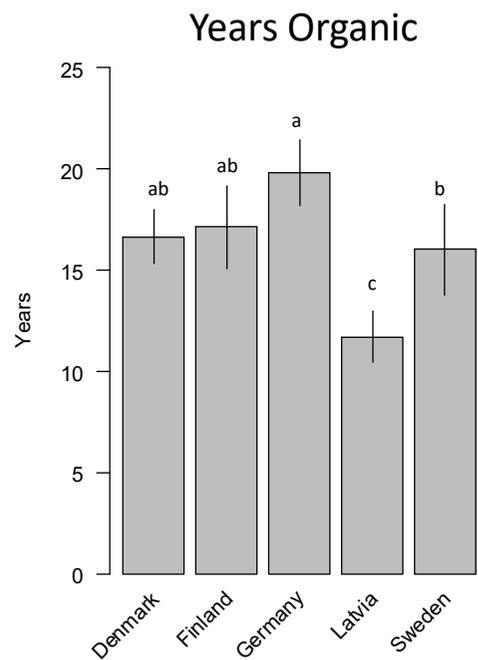

Crop mixtures: Two crops sown together, both used as cash crops.

- In this study crop mixtures most often consisted of a cereal/legume mix

Winter Catch Crop: Winter cover crop, that is present when no cash crop is present. Is not harvested as a cash crop.

- Grass Clover, but also mustard, oilseed rape and green cover mixtures

Results III – Weed community

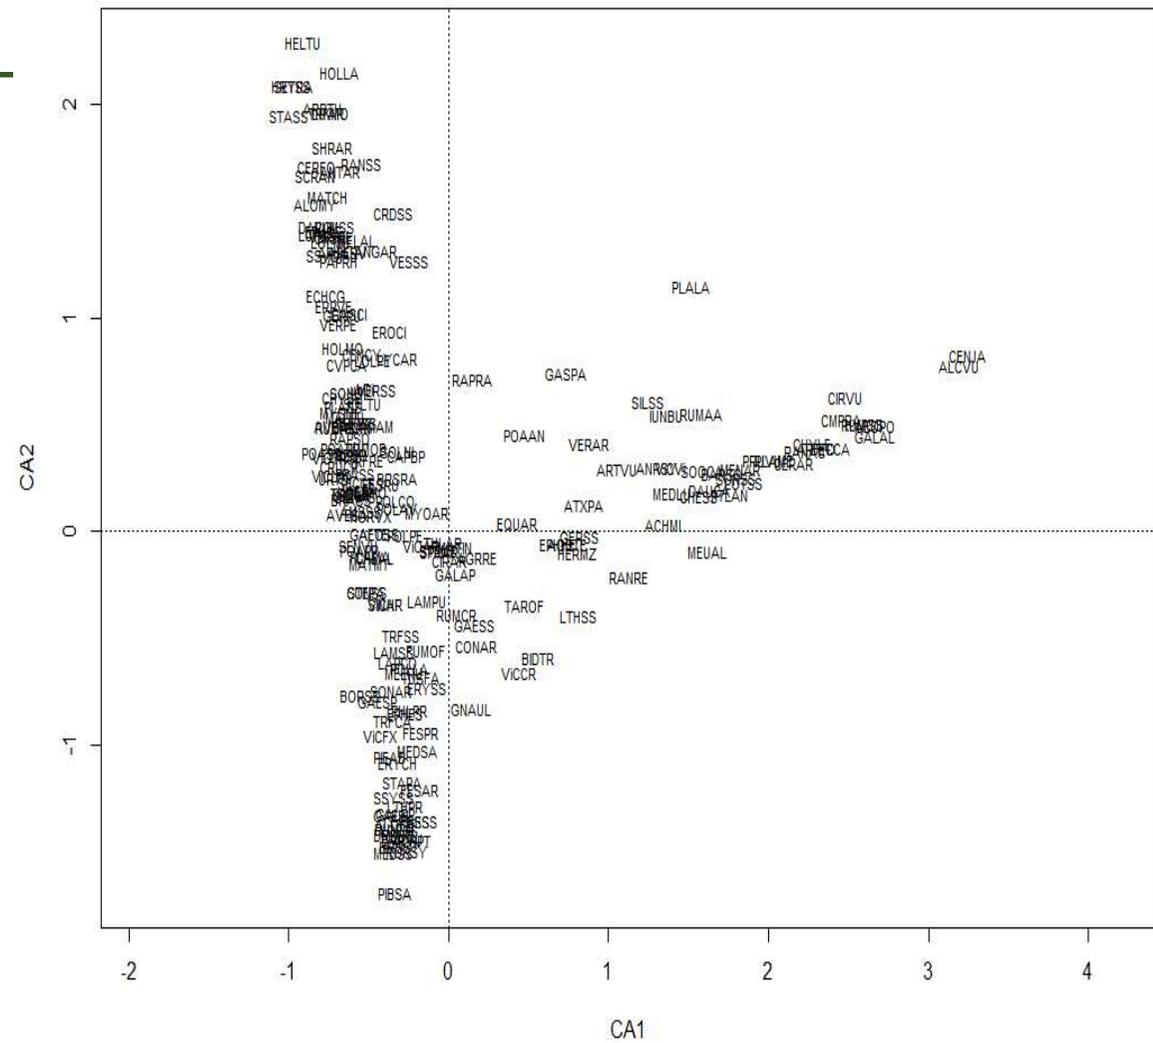

- Geographical dispersal

Ordination plot (CCA) displaying all sites effected by 8 management variables.

Results III – Weed community

Ordination plot (pCCA) displaying the 94 most frequent species as effected by 8 management variables.

- I. Crop diversity strategies are use in low intensities (based on the information provided) and depend on local socio-economic and environmental conditions.
- II. Winter cover crops affect weed species numbers and diversity positively.
Densities were not affected by the implementation of crop diversity strategies.
- III. The data show that the crop diversity strategies have a subtle influence on the weed community, where winter catch crops affect annuals and perennials differently.

Thank you for your attention!

Thanks to all participating farmers, partners and Core Organic
