Is cows’ qualitatively assessed behaviour towards humans related to their general stress level?

Aim
To investigate the relation between cows’ qualitatively assessed behaviour towards humans (QBA) and their general medium-term stress level (measured by faecal cortisol metabolites, FCM).

Animals and Methods
- QBA (Fig. 1) and FCM (Fig. 2) of 316 cows (≤ 200 days in milk) on 25 organic farms
- QBA: fixed list of 20 descriptors, specifically developed for this purpose (Fig. 3)
- FCM: competitive enzyme immunoassay measuring 11,17-dioxoandrostanes in ng/g fresh faeces
- Statistics:
  - analysis of QBA data by principal component analyses (PCA); PC1 reflected valence, PC2 activation (Fig. 3)
  - division of sample into 4 groups regarding combination of valence (‘pos’ / ‘neg’) and activation (‘low’ / ‘high’) (Fig. 4)
  - group comparisons: Kruskall-Wallis test and Wilcoxon post hoc tests

Results
- FCM medians and variation were generally on a low level (Fig. 5)
- cows reacting ‘pos_high’ during human-animal interaction (n=65), ‘pos_low’ (n=93) and ‘neg_low’ (n=99) had similar FCM levels
- ‘neg_high’ cows (n=59) had significantly lower FCM levels than all other groups

Conclusions
- ‘neg_high’ cows presumably had higher fear levels towards humans than ‘pos’ cows, and expressed this more actively than ‘neg_low’ cows
- unexpectedly, ‘neg’ reactions were not related to a higher stress level
- other factors such as social rank or health status might have affected results more profoundly, requiring a more complex analysis including individual factors

Acknowledgements
Sincere thanks to the farmers for project participation. Project has been funded by the Federal Ministry of Food and Agriculture (BMEL) based on a decision of the Parliament of the Federal Republic of Germany via the Federal Office for Agriculture and Food (BLE) under the Federal Organic Farming Scheme (BÖLN) (‘ORGANIC DAIRY HEALTH’ project) and the Hessen State Ministry of Higher Education, Research and Arts (‘LOEWE’ project).
