1 Introduction

1.1 Objectives

The objective of this report is to provide an up-to-date overview of the organic and in-conversion land area, number of holdings, livestock and crop production in all EU-member states and the Czech Republic, Norway and Switzerland from 1993 to 1996. This report forms part of the project “Effects of the CAP Reform and possible further developments on organic farming in the EU” (FAIR 3-CT96 1794) funded by the European Commission. The general objective of the project is to provide an assessment of the impact of the 1992 CAP Reform on organic farming and thus contribute to a better understanding of the effects that current EU policies have on this sub-sector. This is one of five reports that aim to assess *ex post* the impact of EU and other policy measures on organic farming. This report traces the growth and development of organic farming in general and as part of policy measures to support organic farming.

1993 was chosen as the starting point from which to present the data. It represents the year in which most EU member states implemented Council Regulation (EEC) No. 2092/91 defining organic crop production in statutory terms. It was also the first year in which the CAP Reform of 1992 began to have an impact on organic farming, in particular through support under the agri-environment programme (Council Regulation (EEC) No. 2078/92). Two further reports are planned that will extend the data series to 1997 and 1998.

1.2 Methodology

The report is based on data collected by project partners and subcontractors for 18 European countries, and additional information from published and unpublished material that was obtained by the authors. The subcontractors collected the data by surveying designated national/regional control authorities and organic certification bodies, with reference to published official data or other sources. Where possible the data were confirmed by the authors from a variety of other sources, including the responsible authorities in the national agricultural administrations.

The report is divided into two main parts. Part A concerns organic and in-conversion land area and number of holdings in several categories: certified only, EC Reg. 2078/92- supported, total policy-supported and total certified and policy-supported combined. Part B contains a breakdown of land use and stocking by commodity.

The data for certified production represent the situation at the 31 December each year (the required reporting date under EC Reg.

2092/91) or a date as close to this as possible. The data concerning organic production supported under the agri-environment programme (EC Reg. 2078/92) are mainly based on the statistical reporting from each Member State to the EU Commission on the 15 October. In some cases year-end data has been used where this is more reliable.

Following the implementation of EC Reg. 2092/91 in 1993, the quantity and reliability of data has improved considerably. However, the situation varies considerably between countries with respect to certification and financial support for organic farming (see the first report of this project for details of the implementation of the schemes¹). This has an influence on the way in which certified holdings are accounted for in statistics as no unified approach to statistical reporting has been implemented. Some countries use government agencies and certify only according to EC Reg. 2092/91. As EC Reg. 2092/91 does not include any standards for livestock yet, livestock holdings might not be included in official statistics of certified holdings, even though they are following strictly organic principles and are potentially certified with a private body. Other countries rely on private sector bodies for certification, which might follow their own standards. Similarly, some but not all countries require a holding to be certified with the state (following EC Reg. 2092/91) or a private sector body to qualify for the organic farming payments under the agri-environment programme (EC Reg. 2078/92).

The collation of data on organic farming in general is hampered by lack of resources of the certification bodies. This is especially applicable to data on commodities.

In summary, reporting procedures in some countries are inadequate and therefore estimates still need to be used where actual data could not be obtained or are not available.

The report will be updated for 1997 and 1998 data by which time it is to be hoped that any missing data can be included and any necessary amendments made.

Part A Organic and in-conversion land area and holdings

As mentioned above, the situation within Europe varies with respect to legal definitions, certification procedures and financial support for organic farming. Therefore several categories of organic and in-conversion land and holdings can occur in each country, all of which are addressed in the report.

Certified land and holdings

Sections 2 and 3 concern data on the certified land area and number of holdings, both fully organic and in-conversion. This includes land area and holdings certified under EC Reg. 2092/91 and any other certification by state or private sector bodies not included in 2092/91, for example because of the lack of an EU regulation for livestock. Due to the way in which such data is recorded in some countries, it has proved impossible to isolate land area and holdings which are certified exclusively according to EC Reg. 2092/91, or to distinguish between fully organic and in-conversion land area and holdings.

Certified organic farming more than doubled in the EU between 1993 and 1996, increasing from 29 000 to 62 000 holdings covering a land area of 0.7 Mha and 1.6 Mha respectively. In 1996, organic farming represented almost 1.2% of total UAA both in the EU (1.6 Mha out of 133 Mha) and in all 18 study countries (1.7 Mha out of 140 Mha). This figure varies considerably between countries, ranging from less than 1% of total farm land in the majority of countries (BE, CZ, ES, FR, GB, GR, IE, LU, NL, NO, PT) to around 2% in DE, DK and IT, 3% in FI and SE, 5% in Switzerland and almost 9% in Austria.

Agri-environment programme (EC Reg. 2078/92) supported land and holdings

Sections 4 and 5 concern organic and in-conversion land area and holdings that qualify for payments under the EU agri-environment programme (EC Reg. 2078/92). The majority of such holdings are certified (organic or in-conversion) as this is a requirement for payments in most countries. However, in Sweden and some German *Länder*, such a requirement does not exist and therefore some uncertified land is included in these figures.

The majority of organic aid schemes under EC Reg. 2078/92 were not fully implemented by member states until 1996. By 1997, there was almost an eleven-fold increase in the number of organic and in-conversion holdings receiving such support in the EU, from just under 6 000 in 1994 (covering 0.1 Mha) to 65 000 in 1997 (covering an area of nearly 1.3 Mha). When the total number of agreements under EC Reg. 2078/92 are taken into account the organic farming share increased from 1.3% of total agreements in 1994 to 3.9% in 1997 (Table 5-3). Uptake varies between countries, from less than 300 agreements in BE, GB, NL and PT to more than 8 400 in Germany, almost 11 000 in Sweden, 17 000 in Italy and approximately

18 500 in Austria. As a percentage of total agri-environment agreements in each country, uptake is lowest in France and Portugal with less than 1%, while in DK, GR, IT and SE over 10% of agreements relate to the organic option. Organic farming accounts for almost half the land area registered under agri-environment agreements in DK with less than 3% in FR, GB and PT.

Total policy-supported land and holdings

Sections 6 and 7 include all organic and in-conversion land area and holdings supported under the agri-environment programme (EC Reg. 2078/92), the extensification programme (EC Reg. 4115/88), and under national organic support schemes. In those countries which do not require policy-supported organic production to be certified, these figures will include both certified and uncertified land and holdings.

In 1996, there were more than 58 500 policy-supported organic holdings in the EU on 1.25 Mha. Of these, 7 600 holdings and 0.32 Mha were supported under EC Reg. 4115/88 in Germany.

Total certified and policy-supported land and holdings

Sections 8 and 9 provide an overview of the total certified and policy-supported land area and holdings. For the majority of countries, which require policy-supported organic production to be certified, the data presented are the same as in Sections 2 and 3. In Sweden and Germany, however, organic certification is (or was) not always a requirement. In these two cases, the values for policy-supported land and holdings presented in Sections 6 and 7 have been used. As it is not possible to identify which certified holdings receive policy support (most do), and which policy-supported holdings are certified (many are not), these values should be seen as a lower estimate of the actual situation.

In 1996, the total certified and policy-supported organic and in-conversion land area in the EU amounted to 1.75 Mha on 74 500 farms, representing 1.3 % of the total utilisable agricultural area (UAA) and 1.0 % of all holdings. This is slightly more than twice the level in 1993.

2 Certified organic and in-conversion land area

Table 2-1, Figure 2-1 and Figure 2-2 present data on certified land area, both fully organic and in conversion. For most countries, these data are for land that is certified according to EC Reg. 2092/91. Land certified according to other national regulations (e.g. AT, FI, SE pre 1995; NO pre 1996, CH and CZ) is also included.

In all countries except Germany and Greece, the data also include land used solely for livestock production, although livestock production is not currently covered by EC Reg. 2092/91. Data in the strict sense of EC Reg. 2092/91 are not available for these countries.

In Greece, no organic livestock production is recognised. In Germany, livestock-only enterprises are not included in the EC Reg. 2092/91 data shown in the table. Data on certified production available from AGÖL, the German umbrella organisation of producer associations, are presented as a footnote. These data include livestock-only holdings, but AGÖL members do not certify all holdings registered under EC Reg. 2092/91. The degree of overlap between the two sets of data cannot at present be identified.

3 Certified organic and in-conversion holdings

Table 3-1, Figures 3-1 and 3-2 present data on the number of certified holdings, both fully organic and in-conversion. For most countries, these data are for holdings that are certified according to EC Reg. 2092/91. Holdings certified according to other national regulations (e.g. AT, FI, SE pre 1995; NO pre 1996, CH and CZ) are also included.

In all countries except Germany and Greece, the data also include livestock-only holdings, although livestock production is not currently covered by EC Reg. 2092/91. Data in the strict sense of EC Reg. 2092/91 are not available for these countries.

In Greece, no organic livestock production is recognised. In Germany, livestock-only enterprises are not included in the EC Reg. 2092/91 data shown in the table. Data on certified production available from AGÖL, the German umbrella organisation of producer associations, are presented as a footnote. These data include livestock-only holdings, but AGÖL members do not certify all holdings registered under EC Reg. 2092/91. The degree of overlap between the two sets of data cannot at present be identified.

Figure 3-1: Certified organic and in-conversion holdings (n), total by year

Figure 3-2: Certified organic and in-conversion holdings (n), by country and year

Table 3-2 and Figure 3-3 show the certified organic and in-conversion holdings from Table 3-1 as a percentage of the total holdings in each country in 1993. 1993 is the most recent year for which total agricultural holdings data for most countries are available. Where 1993 data is not available, total holdings for other years have been used as indicated in the footnotes.

¹ 1996 total holdings

Figure 3-3: Certified organic and in-conversion holdings as % of 1993 total agricultural holdings

4 Agri-environment programme (EC Reg. 2078/92) supported organic and in-conversion land area

Table 4-1, Figure 4-1 and Figure 4-2 show the organic and in-conversion land area supported under the agri-environment programme (EC Reg. 2078/92). In most countries, only certified organic and in-conversion land area qualifies for such payments, but not all certified land is necessarily eligible or entered for support. However, for those countries where certification is not a requirement (SE and some regions in DE and IT) the data include both certified and uncertified land (see Section 8).

Figure 5-3: Agri-environment programme (EC Reg. 2078/92) supported organic and in-conversion holdings as % of total agri-environment programme agreements

6 Total policy-supported organic and in-conversion land area

In addition to the land area supported under the agri-environment programme (EC Reg. 2078/92) (see Section 4), organic farming has also been supported:

- under the EU extensification programme (EC Reg. 4115/88) in DE, FR and LU;
- by national programmes in DK before 1994 and in SE, FI and AT before EU accession in 1995; and
- by national programmes in the non-EU countries studied.

Table 6-1, Figure 6-1 and Figure 6-2 show the total organic and in-conversion land area supported by these different measures between 1993 and 1996. In most countries, only certified organic and in-conversion land area qualifies for such payments, but not all certified land is necessarily eligible or entered for support. However, for those countries where certification is or was not a requirement (SE and some regions in DE and IT) the data include both certified and uncertified land (see Section 8).

8 Total certified and policy-supported organic and in-conversion land area

Table 8-1, Figure 8-1 and Figure 8-2 provide an overview of the total certified and policy-supported organic and in-conversion land area. In all cases except for Sweden and Germany, the data presented here correspond to the certified land area in Table 2-1 as all policy-supported land is also certified.

In Sweden (1995 and 1996) and Germany however, where certification is not always a requirement of policy support, no reliable data on the policy-supported land that is uncertified exist. In these cases, the total policy-supported area from Table 6-1 has been used, assuming that almost all certified land is policy-supported and that therefore the policy-supported area represents a reasonable estimate of the total certified and policy-supported area. Data for uncertified policy-supported land for 1993 and 1994 in Sweden are however available and have therefore been combined with the certified area to form the totals for these two years. Although certification is also not a requirement of policy support in all regions of Italy, it is not possible to identify the prevalence of uncertified in the policy-supported land area; the certified area as the larger of two figures has therefore been included.

Figure 8-1: *Total certified and policy-supported organic and in-conversion land area (ha), total by year*

Figure 8-2: *Total certified and policy-supported organic and in-conversion land area (ha), by country and year*

Table 8-2 and Figure 8-3 show the total certified and policy-supported organic and in-conversion land area from Table 8-1 as a percentage of the total utilisable agricultural area (UAA) in each country in 1995. 1995 is the most recent year for which total UAA data for most countries are available. Where 1995 data is not available, total UAA for other years has been used.

9 **Total certified and policy-supported organic and in-conversion holdings**

Table 9-1, Figure 9-1 and Figure 9-2 provide an overview of the total number of certified and policy-supported organic and in-conversion holdings. In all cases except for Sweden and Germany, the data here correspond to the certified holdings in Table 3-1 as all policy-supported holdings are also certified.

In Sweden (1995 and 1996) and Germany however, where certification is not always a requirement of policy support, no reliable data on the policy-supported production that is uncertified exist. In these cases the total number of policy-supported holdings from Table 7-1 has been used, assuming that almost all holdings that are policy-supported are also certified and the number of policy-supported holdings represents a reasonable estimate of the total. Data for uncertified policy-supported holdings for 1993 and 1994 in Sweden are however available and have therefore been combined with the certified holdings to form the totals for these two years. Although certification is also not a requirement of policy support in all regions of Italy, it is not possible to identify the prevalence of uncertified in the policy-supported holdings; certified holdings as the larger of two figures have therefore been included.

¹ 1996 agricultural holdings

Figure 9-3: *Certified and policy-supported organic and in-conversion holdings as % of 1993 total agricultural holdings*

Part B Organic stocking and land use

Part B contains a breakdown of stocking and land use by commodity. The data are presented in four main sections: Livestock, including milk (Section 10), arable crops, including cereals, pulses, oilseeds and root crops (Section 11), horticulture, including vegetables, perennial and fruit crops (Section 12) and grassland and fodder crops (Section 13). Section 14 shows the distribution of certified organic and in-conversion land area by crop type in 1996. Data normally refer to certified organic but in some cases in-conversion livestock and crops have been included and cannot be differentiated.

There are no official reporting requirements for such data and availability and quality varies considerably between countries. One of the main reasons for this is the lack of resources of the inspection/certification bodies, many of which do not have the facilities or manpower to isolate and record such data separately. Availability of data can also vary within countries where, for example, data may only have been supplied by the larger certification bodies or from certification bodies representing only one region. As far as possible, this has been indicated by the use of footnotes. Due to the existing gaps in the data no totals for the EU or for all 18 study countries have been presented. The authors hope that some missing data can be included in the updates to this report for 1997 and 1998.

A number of the tables in Section 10 show organic as a percentage of total livestock in those countries where data are available. At more than 10%, Austria has the highest share of certified organic dairy and other cattle, with BE, FI, FR, GB, LU and NL all less than 0.5%. Organic pig and sheep production is again most widespread in Austria where 1.08% of pigs are managed organically compared to less than 0.3% in the other countries (BE, DK, FI, FR, GB, LU, SE) and just over 29% of sheep are organic compared to 9% in Denmark, 5.5% in Sweden and 2.6% in Finland. Although few data are available, organic goats account for 10% of total goats in Sweden, 5.5% in the Netherlands and 3% in Belgium.

In 1996, total organic arable land area covered 295 000 ha in the EU and almost 300 000 ha in all 18 study countries. These figures represent around 18% of total organic and in-conversion land area, with BE, DE, DK, FR, LU, NL, SE the highest at between 20 and 30% and Austria the lowest at 10.31%. When the non-EU countries are included, Switzerland is the lowest at 5.23% with no data available for Ireland and the Czech Republic.

B Stocking and land use

Total horticulture in the EU covered an area of just under 130 000 ha in 1996 (8.2% of total organic and in-conversion area) and just over 130 000 ha in all 18 study countries (7.8%). As a percentage of total organic and in-conversion land area, organic horticulture is highest in the Mediterranean countries with Greece at 79%, Portugal at 69%, Spain at 21% and Italy at 19%. Austria is the lowest at 0.2%, but this figure represents perennial crops only.

Organically managed grassland (including fodder crops) made up the largest share of total organic and in-conversion land area with 55% in the EU and 56% in all 18 study countries in 1996. The country with the largest share of organically managed grassland was Switzerland at 91%, followed by Norway at 89% and the United Kingdom at 79%.
