Single-phase feeding and compensatory growth in growing and finishing pigs

Problem
Meeting growing pigs’ nutrient requirements with on-farm-produced cereals and protein feed ingredients can be hard. To overcome the risk of undersupplying pigs with amino acids, diets are formulated with higher contents of protein than recommended. With 100 % organic feedstuffs, it is difficult to match the amino acid requirement without a very high level of protein. This can decrease the health and welfare of weaners and increase nitrogen losses.

Solution
A single-phase feeding strategy and utilising pigs’ capacity for compensatory growth (Figure 2) can lessen the need for diets with high protein and amino acid content in the early stage of the growing phase. It can promote the use of locally produced protein feed resources in diets to organic pigs.

Benefits
Single-phase feeding of pigs followed by growth compensation might reduce nitrogen emissions, as it excludes the need for a high protein and amino acid content in the diet in the early stages of growth. It enables efficient use of locally produced protein feed resources and can reduce soya intake by pig and simplify feed manufacturing, feed handling and diet formulation at the farm level. This practice can reduce the cost of the feed for the weaners.

**Practical recommendation**

- Limit the supply of essential amino acids during early growth and utilise the pigs’ capacity to fully compensate for the restriction by increased protein retention and faster growth during later growth phases.
- Crude protein and lysine contents can be substantially reduced, below common standards (i.e. crude protein to 16.5% and digestible lysine between 0.70-0.80 g standardised ileal digestible (SID) lysine/MJ NE), in well-balanced diets.
- A reduction in crude protein content, from 15.5 to 14.5 g SID/g SID lysine can lower the nitrogen output by approximately 10%.
- Formulate diets on a digestible amino acid basis rather than on a total amino acid or crude protein basis.
- High-quality protein feed ingredients such as faba beans, peas, oil seed-, dairy- and cereal-based by-products, aquatic resources, etc., or a combination of them, can be used.
- At the pig level, this practice can reduce soya bean cake utilisation (14%) and increase pea utilisation (22%).
- Careful follow-up of the pigs’ feed consumption, growth and health status is recommended.

About this practice abstract and OK-Net EcoFeed

**PRACTICE ABSTRACT**

**OK-Net EcoFeed:** This practice abstract was elaborated in the Organic Knowledge Network on Monogastric Animal Feed project. The project is running from January 2018 to December 2020. The overall aim of OK-Net EcoFeed is to help farmers, breeders and the organic feed processing industry in achieving the goal of 100% use of organic and regional feed for monogastrics.
