Acknowledgements

Our grateful thanks go to the following who contributed to this report:

- Rural Business Research (www.ruralbusinessresearch.co.uk) and its constituent RBR Units throughout England who were responsible for data collection in England;
- The Welsh Farm Business Survey unit at Aberystwyth University who were responsible for data collection in Wales;
- Chris Firth and Ulrich Schmutz (HDRA) for assistance in interpretation of the limited horticultural data;
- John Burrows (Aberystwyth University) for technical assistance with the clustering procedure;
- Department for Environment, Food and Rural Affairs (Defra) Statistics and Farm Business Survey Divisions for assistance with recruitment lists, supplying data for analysis and comments on the reports;
- Defra for hosting the reports generated from this project on their website (https://statistics.defra.gov.uk/esg/index/list.asp?i_id=130)
- And most especially to all the farmers who gave of their time and information, without which this work would not be possible.

Data not collected directly were supplied by Defra with whom copyright rests. Although all efforts are made to ensure the quality of the farm data supplied, the copyright holder, the original data producer, Defra and the Data Archive, bear no responsibility for the accuracy or comprehensiveness of these materials, or for their further analysis or interpretation.

We gratefully acknowledge funding from Defra. The views and interpretations expressed here are those of the authors, and do not represent views of the Department.

Executive Summary

This report presents results of research on the financial performance of organic farms in 2007/08 and 2008/09, carried out for the Department for Environment, Food and Rural Affairs (Defra). This research concludes project OF0373 and builds on previous work on the economics of organic farming carried out at Aberystwyth University (Projects OF0190, covering 1995/96 to 1998/99 and OF0189, covering 1999/00 to 2004/05)¹.

Analysis of the Defra Data Archive for 2008/09 found a total of 241 businesses with some organic land, and of these holdings, 188 met the criterion for inclusion within this study by having greater than 70% fully organic land. In total, data from 180 organic farms were utilised in the analysis, clustered to a total of 767 comparable conventional holdings. It was not possible to identify comparable conventional businesses for seven organic farms, and one farm was excluded for technical reasons, though the gross margin results from seven of these businesses could be utilised.

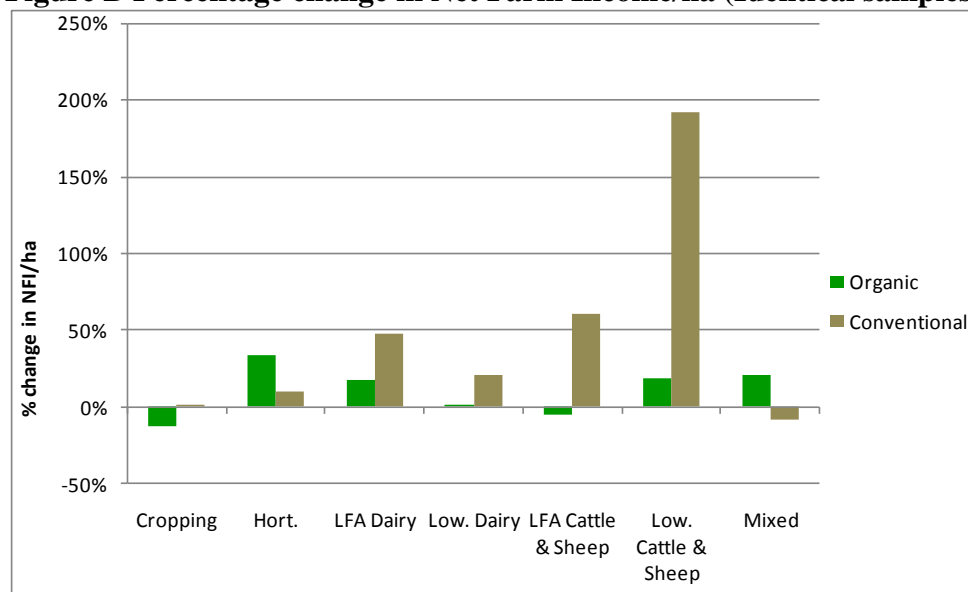

The **full sample** analysis utilises data from 180 organic farms to provide a comparison of organic and comparable conventional farm income data in 2008/09, (with the 2007/08 sample provided for a non-identical comparison). Figure A below indicates that, for the full sample, for most farm types, Net Farm Incomes (NFI) remained at or above the level of conventional farms in 2008/09. Organic LFA livestock and mixed farms were considerably more profitable than their conventional comparisons. However, the organic horticulture and poultry farm types did not perform as well as conventional, mainly as a result of the specialisation/intensity of the comparable conventional systems, but the small organic sample size may also have affected the results.

Figure A Organic and conventional Net Farm Income/ha (Full samples, 2008/09)

The data are also analysed as an **identical sample** that compares the performance for an identical sample of organic and comparable conventional farms in each of the two years 2007/08 and 2008/09. This comparison is shown in Figure B (opposite), which highlights that most organic farm type NFIs were similar to the previous year, but there were some large gains for comparable conventional farms. Within the organic sector, horticulture, lowland cattle and sheep, mixed and LFA dairy farms all showed an improvement in NFI, whilst organic cropping and LFA cattle and sheep NFI declined marginally. Both organic and conventional sectors saw input costs rise in 2008/09, whilst within the conventional sector livestock farms showed considerable improvement in profitability, reflecting gains in conventional livestock and milk prices during the year.

Figure B Percentage change in Net Farm Income/ha (Identical samples, 2007/08 and 2008/09)

In summary, Table A shows NFI per farm and per hectare for full and identical samples in 2007/08 and 2008/09. It highlights that the main organic farm types studied over the two year period covered by this report remain financially competitive with comparable conventional businesses; their income not diverging significantly from that of conventional farms. The only exceptions appear to be organic poultry and horticulture that were outperformed by their conventional counterparts, in part due to the intensification and reliance on external inputs of the conventional holdings, but the small sample sizes mean results should be treated with caution.

Table A Summary of Net Farm Incomes (£/farm and £/ha) by farm type, 2007/08 and 2008/09

Introduction

This Defra funded project, is the final report of Project OF0373, and continues the series of reports on organic farm incomes started with the 1995/96-1998/99 period under MAFF project OF0190 and continued from 1999/00-2004/05 under Defra Project OF0189².

The aim of this report is to show the financial performance of organic farms, differentiated by farm type for 2008/09 including comparisons with similar conventional farms and with 2007/08 data, in order to:

- Inform Defra policy-making with respect to organic farming, and
- Provide a basis for assessments by farmers, advisers and other interested parties of the farm-level implications of conversion to and continued organic farming.

The project's specific objectives include:

- Collection of farm accountancy data from 70 organic farms in England and 10 in Wales in the 2006/07 to 2008/09 financial years using a new approach which is fully integrated with the English and Welsh Farm Business Surveys. (This replaces the previous direct collection of data across England by Aberystwyth University and has enabled an increase in the number of farmers included as well as better regional and farm type representation).
- Analysis of the data collected in combination with data for approximately 100 organic businesses already available from the main Farm Business Surveys to produce an annual report on organic farming costs, incomes and margins.

This report includes a section on methodology (see Appendix 5), which shows the data sourcing and sampling techniques used to obtain a representative organic farm sample, as well as an explanation of the clustering procedure used to select comparable conventional farms (CCF) to match the organic farms. The financial results are presented with an explanation of the results and brief highlights, followed by summary data for each farm type. Detailed gross and net margins are included for livestock and cropping enterprises, as are benchmark costs of production per kg or tonne for arable, milk, beef and lamb. The detailed whole-farm results can be found in Appendix 1.

² Previous reports can be found at: https://statistics.defra.gov.uk/esg/index/list.asp?i_id=130

1. Methods

In this report, financial and physical farm data are shown for the 2007/08 and 2008/09 financial years. The report includes an analysis of organic farms including comparisons with similar conventional farms and between year comparisons, presented as a full and identical sample.

The full samples include all data available for organic holds with over 70% fully organic land within the Defra dataset, collected through the Farm Business Survey (FBS), and compares the performance of organic farms with clustered comparable conventional farms (see below for a fuller explanation). The identical samples include data from identical samples of organic and comparable conventional farms, compared over two years to highlight between year changes, such as output or input cost changes within each sector. Occasionally the two datasets may show conflicting results, but the full sample is the best indicator of organic vs. conventional comparisons, the identical sample the best indicator of between year changes within each sector.

The total number of organic farms for 2008/09, referred to as the full farm sample data, is shown alongside the identical datasets. Identical sample comparisons are presented for all main farm types and comprise identical farm groups that are present in both the 2007/08 and 2008/09 datasets. It was not possible to produce an identical poultry sample due to a limited sample size, therefore data for the full samples in 2007/08 and 2008/09 are presented, but comparisons should be treated with caution due to changes in the sample composition between years.

Summarised and detailed financial input, output, income, returns to labour and capital, liabilities and assets and some physical performance measures are presented based on current FBS data collection and collation guidelines³. The full samples of organic farms per robust farm type are sufficiently large to give some reasonable level of confidence in the data although it should be noted that the organic farm samples are not necessarily statistically representative of their type, as most have been selected to meet the statistical needs of the Farm Business Survey as a whole, not this study. However, the results can be seen as a reasonable indication of farm income levels for comparable organic and conventional farms. Smaller farm samples should be treated more cautiously as there is a possibility for outliers (especially larger farms) to have a significant influence on the average results (these effects can be seen within the full horticulture sample).

An additional element of this work is the inclusion of comparable conventional farm data (obtained from the main FBS sample) for the farm types shown. Each organic farm within this study was matched with an appropriate cluster of conventional farms based on the resource endowment indicators for individual organic farms. Indicators included farm type, FBS region, Less Favoured Area (LFA) status, utilisable agricultural area (UAA); milk quota held (where applicable) and farm business size. The cluster farm data were averaged for each farm type to derive the comparable conventional farm (CCF) data based on the organic farms from the identical and full farm samples.

This report includes the newer Farm Business Income (FBI) measure adopted by Defra and the Welsh Assembly Government. This income measure is intended to reflect more closely actual profitability of farm businesses and does not include the adjustments designed to make farms comparable in terms of land tenure, reliance on borrowed capital and reliance on unpaid staff which Net Farm Income and Management and Investment Income were intended to do. As a result of the exclusion of notional costs for unpaid resources, Farm Business Income values are typically higher than Net Farm Incomes, but the relative performance of organic and conventional farms is similar in most cases. 2008/09 FBI data now also includes “directors remuneration”, which is shown as a capital withdrawal from the business, though this affects very few farms.

³ See <https://statistics.defra.gov.uk/esg/publications/fab/2008/excel.htm> for further information on the farm accounting system employed in England and Wales by Defra Economics Division.

Gross and net margin data are included for selected organic livestock and crop enterprises. Margins for organic dairy herds are presented on a herd size and top performing herds as well as regional basis, in addition to a two year identical sample, presented for the first time in this report. Cattle and sheep gross margins are shown for lowland and LFA farm types. For arable crops, costs of production per tonne are also shown. Crops covered include winter and spring wheat, spring barley, spring oats, and beans for stock feed. Where available, 2007/08 organic and conventional gross margin data are shown alongside the 2008/09 data. The conventional farm data are included from holdings that have been clustered within the whole farm section of this report.

Benchmark costs of production data are shown for arable crops (alongside net margin results), organic milk, suckler store, finishing beef and lamb production enterprises. It was possible to derive costs of production for milk from the full FBS sample, in addition to costs of production for milk, beef and lamb from the Welsh Farm Business Survey, including comparisons with results from conventional farms in Wales. The results for the beef and lamb enterprises continue to show the importance of support payments in making these enterprises viable for both organic and conventional producers.

As in the 2007/08 report, data was collected as part of the English and Welsh Farm Business Surveys by the constituent Rural Business Research Units in England and by the Welsh Farm Business Survey Unit at Aberystwyth University. Standard Farm Business Survey methodology⁴ was used. It should be noted that in the 2008/09 FBS year a methodological change led to the introduction of a different allocation and apportionment model than had previously been used for determining the notional fixed costs attributable to agriculture, diversified enterprises, single payment scheme and agri-environment scheme. Hence, the fixed costs notionally attributable to agriculture, and hence to individual agricultural enterprises (e.g. dairy, wheat etc) cannot be compared directly with those from 2007/08 due to this methodological change. Readers can access full details of this methodological change at: https://statistics.defra.gov.uk/esg/asd/fbs/sub/fbs_comm.htm.

Financial results have been obtained from businesses in England and Wales with account years ending between December and April. The data for all the organic and non-organic farms surveyed was collated by Defra, stored in the Defra Data Archive and made available to the Aberystwyth University team for analysis.

The sample of ca. 100 wholly or partly organic businesses occurring by chance within the English and Welsh Farm Business Surveys was extended by 80 businesses to better reflect the regional and farm type distribution of organic farms in England and Wales 2005/06 (see recruitment guidelines in Annex 4), and to enable minimum sample sizes of 15 to be achieved for key robust farm types and at least 5 for specific main types. The 2008/09 sample shows a further increase in the number of existing Farm Business Survey participating farms converting to organic, enhancing the organic sample size further, and for the first time it has been possible to carry out a poultry sector analysis, though albeit still a small sample.

The analysis within this report is focused on businesses having at least 70% organic land status in 2008/09. Of the total 241 businesses with some organic land identified in the Defra Data Archive, 188 met the >70% fully organic land criterion (Table 1). Of the 188 >70% organic holdings, it was not possible to identify comparable conventional businesses for 7, and 1 was excluded for technical reasons (e.g. dispersal of dairy herd mid-year). However, the gross margin results from 7 of these 8 businesses could be utilised.

⁴ See <http://statistics.Defra.gov.uk/esg/publications/fab/2007/excel.asp> for further information on the farm accounting system employed in England and Wales by Defra Economics Division.

All farms were classified by constituent EC type (1985 EC Typology described in Commission Decision 85/377/EEC) and for the purposes of this report are presented in groups by robust type according to the UK farm classification system (revised 1994)⁵. (See Appendix 2 for more information). The constituent EC types are determined using standard gross margins (SGMs) for conventional farms to estimate European Size Units (ESUs). This classification system may not appropriately reflect the enterprise profile of organic farms due to differences in gross margin values, but there is currently no alternative classification system available that reflects organic gross margins better and it is considered that the resulting classification errors are likely to be small. The distribution of the businesses by size (ESU) and type is shown in Table 2 (opposite).

To ensure anonymity of results for farmers participating in these surveys, no data are presented for groups of less than five farms. However, it should be noted that individual farm results can still have a significant effect on average results for these small samples, so that where possible, results are presented for groups of more than 15 businesses. In some cases, robust types (e.g. types 1 (specialist cereals) and 2 (general cropping)) have been merged to achieve this. Where results are presented for groups of less than 15, the results should be treated with some caution.

The 2008/09 report continues to utilise the new software process that was employed to carry out the 2007/08 data analysis, ensuring full comparability between years. To improve between year comparisons in the whole-farm datasets, the data samples are also presented as a continuous (identical) sample for most farm types. It has not been possible to achieve this for the poultry farm type, but overall, the sampled farms have not changed significantly from the 2007/08 sample.

For the whole-farm results presented in Section 3 and in Appendix 1, data for comparable conventional businesses has been obtained using a clustering procedure to identify a group of similar conventional businesses for each individual organic business. The average for the group of individual organic businesses is then compared with the average for the group of conventional farm clusters. The intention is to ensure, as far as possible, that differences between organic and conventional farms can be attributed to their management system and not to differences in business resource endowment that are not related to the production system employed. The method used is described in more detail in Appendix 5.

The identical sample farm clusters show identical organic and conventional clustered farm groups for both 2007/08 and 2008/09, allowing greater analysis between years, though sample sizes are generally smaller than within full samples due to the exclusion of farms not occurring in the dataset for both years. The full sample comparisons represent the full set of clusterable organic data available for both 2007/08 and 2008/09, presented with the average of the comparable conventional farm clusters.

This report also includes conventional data for comparison (where possible), for both gross and net margins, and costs of production data. It has also been possible to produce a two year identical organic and conventional sample for dairy gross and net margins, and costs of production, allowing greater analysis of changes during the time periods covered by this report.

As a result of the changes to data collection approaches in 2006/07, it has not been possible since to collect the livestock sales weight data needed to prepare cost of production data across both England and Wales, however it has been possible to do this as part of a separate project in Wales. Livestock sales costs of production data for Welsh farm businesses only (including conventional farm comparisons) are included in this report, but may not reflect the more intensive lowland conditions prevailing in some parts of England.

2. Whole-farm results

2.1 Presentation of results

The summary section tables for each farm type show breakdowns of average outputs, inputs and incomes in £/ha; for cropping, horticulture (intensive horticulture), poultry, LFA and lowland dairy, LFA and lowland cattle and sheep and mixed farms for identical (where available) and full samples. The terms *input* and *output* are used to define financial values rather than physical quantities (for further definitions of terms see Appendix 3). All whole-farm results for each farm type in this section and the appendices are simple averages.

Tables A1 to A8 in Appendix 1 (page 51 onwards), provide details of whole-farm outputs, inputs, incomes, returns to labour and capital, asset and liability information, land utilisation and crop performance, and stocking and livestock performance for the eight farm types. Other physical information available, in addition to the financial data collected, includes figures for livestock units per forage hectare, and labour units per farm. Where direct labour data were not available, labour units have been derived from wages paid using standard agricultural wages (based on Agricultural Wages Board). All labour-use figures presented are, however, based on estimated hours and should be treated with caution.

Values per hectare shown are weighted averages per hectare of farm utilised agricultural area (UAA) rather than per hectare of a specific enterprise because presenting the whole-farm situation reflects the interdependence of enterprises. For example, organic horticultural businesses cannot crop their entire land each year and this has a considerable influence on the overall farm profitability. However, gross/net margin data are shown separately to provide an indication of individual enterprise performance within farm businesses.

In line with changes to Farm Business Survey practice, two main income measures are shown: Net Farm Income and Farm Business Income. Other previously used income measures (management and investment income, occupiers' net income and cash income are not shown) but can be derived from the results presented if required.

Net Farm Income (NFI) represents the return to farmer and spouse for their manual and managerial labour and on the tenant-type capital invested in the farm. For this measure, all farms are effectively treated as tenanted and a rental value is imputed as an expense for owner-occupied land. The cost of permanent improvements to farms, together with any capital grants relating to such work, are excluded, although such landlord-type improvements will be reflected in higher rent or rental value charges. Debt servicing charges incurred by farmers on farm borrowing or the leasing of equipment are also excluded. Unpaid labour (other than that of farmer and spouse) is treated as if paid at standard rates.

Farm Business Income (FBI) represents the return to all unpaid labour (farmers, spouses and others with an entrepreneurial interest in the farm business) and to all their capital invested in the farm business including land and farm buildings. FBI excludes notional rental values for owner-occupied land and unpaid labour included in NFI, but includes interest and other capital charges. It is designed to better reflect overall business performance including the increasing levels of business diversification currently found on farms. 2008/09 data also includes directors remuneration as a capital withdrawal from the business, in line with FBS practise.

2.2 Summary of whole-farm net farm income results

Table 3 summarises the Net Farm Income (NFI) results for *identical* and *full samples* of organic and similar conventional farms on a whole farm and per ha basis for 2007/08 and 2008/09.

Table 3 Summary of Net Farm Incomes by farm type, 2007/08 and 2008/09

2.3 Cropping farms

For detailed results see Appendix 1, Table A1, page 52.

Data from 18 organic cropping farms have been used for the two-year comparison of identical farms, where one farm was located in North-East England, two in Yorkshire & Humber, two in East Midlands, one in West Midlands, three in Eastern, three in South-East and six in South-West England. In total, data for 25 organic cropping farms were suitable for full sample analysis in 2008/09.

Full sample organic and conventional: Average organic farm size was greater in terms of land area (UAA) and business size (ESU) in the 2008/09 full sample. A higher proportion of the organic UAA was used for peas/beans and grassland, reflecting the importance of a more mixed organic cropping system. The number of livestock units was higher for the organic samples with more reliance on beef than sheep. Grazing livestock stocking rates were low on both organic and conventional farms at 0.8GLU/eff. forage ha for organic, 0.9GLU for conventional. Annual labour units per farm were higher for the organic farms in 2008/09, at 3.3ALU/farm compared with 2.4 for the conventional full samples. When labour use is calculated per 100ha of land area, the figures are more similar at 1.4 and 1.2ALU/100ha for organic and conventional respectively.

Total organic output was 10% higher than conventional output in 2008/09, with lower cropping but higher livestock output and higher subsidy payments. The organic farms had a cropping area of 48% of their total area, with more emphasis on cereals other than wheat and barley, whilst conventional farm cropping area was higher at 69%. Organic wheat yields were lower than conventional, 3.8t/ha vs. 8.5t/ha, but organic wheat prices were 86% higher than conventional at

£207/t. Organic livestock output was higher with 67% more livestock units (LU) per holding. Organic farms had proportionally more beef, with conventional farms more evenly balanced between beef and sheep. Organic finished beef achieved a 7% price premium, though store cattle prices were 9% higher on conventional holdings, and lamb prices were near identical. Organic farms received higher area payments, with agri-environment payments £80/ha greater. Agri-environment payments represented approximately 9% of total output at £127/ha for the organic farms compared with 4% for the conventional farms in 2008/09. Overall, support payments comprised 23% of farm revenue on organic and 19% on conventional farms.

Organic costs were 19% higher than conventional farm costs in 2008/09, mainly due to greater labour and machinery costs. Organic livestock inputs were higher, whilst conventional crop inputs were higher, reflecting the variance in farming systems. Overall the organic farms achieved an 8% higher organic NFI and 11% higher FBI. Organic farm return on tenants capital was 19.6%, conventional at 16.8%, whilst organic return per labour unit was £27,500, conventional was 3% higher at £28,354.

Identical sample organic and conventional: The identical organic sample showed farm output falling by 3%, mainly as a result of falling crop output, whilst conventional farms increased output by 9%. Organic inputs decreased slightly, but conventional farm inputs increased by 12% in 2008/09. The organic sample NFI decreased by 13% while the conventional sample was unchanged between years.

Figure 1 Cropping farm output (£/ha, Identical samples, 2007/08 and 2008/09)

Figure 1, highlights the reduction in organic cropping output whilst conventional cropping output has increased. Livestock and agri-environmental payments continued to be of more importance to organic farms. Figure 2 highlights the increase in conventional inputs.

Figure 2 Cropping farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.4 Horticulture

For detailed results see Appendix 1, Table A2, page 60.

Data from 5 organic cropping farms have been used for the two-year comparison of identical farms, where one farm was located in North-West England, three in Eastern and one in South-West England. The full sample includes seven holdings in total, three specialist fruit, three specialist glass and one other type horticultural holdings. One large organic holding is excluded from the identical sample due its very large influence as an outlier on such a small sample, and accounts for much of the large difference in the organic full sample results between the two years.

Farm Business Income	42	1333	79	1491	2592	2458	639	1009

Full sample organic and conventional: Both organic and conventional samples showed similar land use characteristics, with the majority of land cropped with only a small area of forage, and a low number of livestock. Annual labour units (ALU) were also similar between samples, organic at 4.5 ALU/farm, conventional at 4.7 ALU/farm.

The organic sample had a lower overall output than the conventional sample, despite a higher cropping output. The large fall in output between years is mainly due to one farm's influence, rather than a substantial fall in organic output overall (see identical sample results). Conventional farms had considerably higher miscellaneous income but lower support payments. Input costs were very similar between holding types but overall organic NFI was around a quarter of the conventional figure, though the organic FBI was closer to the conventional figure.

Identical sample organic and conventional: The identical organic sample showed organic farm output falling slightly as a result of lower miscellaneous output, whilst conventional cropping output also fell but miscellaneous income remained similar. Both sectors reduced inputs in 2008/09, resulting in slightly higher NFI and FBI, the organic sample NFI remained negative though.

Figure 3 Horticulture farm outputs (£/ha, Identical samples, 2007/08 and 2008/09)

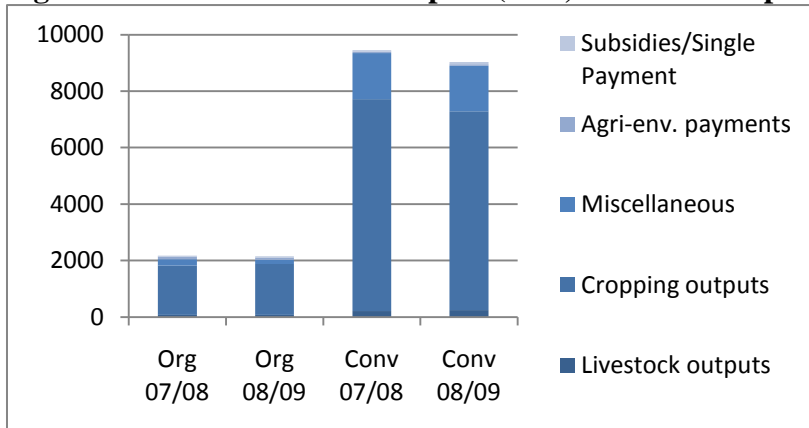

Figure 3, shows similar organic output whilst conventional output had decreased. Both sectors showed very low reliance on support payments and livestock, the majority of output from cropping. Figure 4 highlights a slight reduction in organic inputs, and a larger decrease in conventional inputs.

Figure 4 Horticulture farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.5 Poultry farms

For detailed results see Appendix 1, Table A3, page 68.

Whole-farm financial data were obtained from five organic poultry farms, two egg producers and three broiler units. Although not possible to produce an identical sample, a full sample with clustered conventional data is shown for both 2008/09 and 2007/08.

Table 6 Summary data for poultry farms (£/ha), 2008/09

Net Farm Income	607	1293	829	1398
Farm Business Income	1112	1310	1003	1338

Full sample organic and conventional: The sample shows that the organic units are larger both in terms of area (UAA) and business size (ESU) (mainly due to the influence of one very large organic unit). The organic units have around 70% of their effective area as forage, the conventional units only 47%. The number of livestock kept on the organic farms is lower than conventional at 4.3 LU/ha and 5.1LU/ha respectively, with average organic poultry numbers of 79,287. The organic GLU/forage ha is considerably lower at 6.0 compared to 10.8, reflecting the greater area used for organic poultry production. Cropping area is similar on organic units, with labour use slightly higher on organic units, at 2.6 ALU/farm compared with 2.5 ALU/farm on the conventional farms, though organic labour per 100ha is lower at 5.4ALU, conventional at 6.3ALU/100ha.

The organic NFI was only 59% of the conventional, though the FBI was much closer, at 75% of the conventional figure. Total farm output was lower on organic units, though so were costs, but the figures highlight the high input, high output nature of the business.

Figure 5 Poultry farm outputs (£/ha, Full samples, 2007/08 and 2008/09)

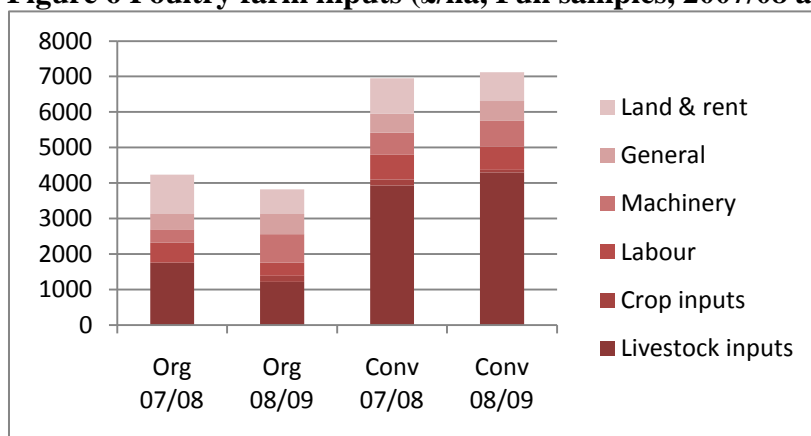

Figure 5 shows increased output for both sectors with very low reliance on support payments. Figure 6 highlights a slight decrease in organic inputs, and a marginal increase in conventional inputs.

Figure 6 Poultry farm inputs (£/ha, Full samples, 2007/08 and 2008/09)

2.6 LFA dairy farms

For detailed results see Appendix 1, Table A4, page 72.

Five organic farms were suitable for the LFA dairy identical farm analysis where two farms were located in North-West England and three in Wales. In total, the full sample of LFA organic dairy farms amounted to seven farms.

Farm Business Income	649	302	698	438	655	273	678	447

Full sample organic and conventional: Average farm size in the organic sample was approximately 6% higher, whilst business size was 4% lower. Labour was higher for the organic sample at 2.5 ALU/farm, conventional at 2.1 ALU/farm, though labour per 100ha was closer, organic at 2.7ALU, conventional at 2.4ALU/100ha. The organic stocking rate of 1.3 GLU /effective forage ha, equivalent to 87% of the conventional level of 1.5 GLU/effective forage ha.

Organic farm output was 13% higher than conventional, due to 11% higher milk output and 200% higher agri-environmental payments. The organic milk price was 33% higher at 32.5 ppl, conventional at 24.4ppl. Organic farm milk yield averaged 5889 litres per cow, 3% below the conventional average of 6040 litres. Organic inputs were higher, as a result of higher feed, labour and machinery costs, but had lower crop input costs. Overall, the organic NFI was 27% higher than the conventional, the organic FBI 52% higher in 2008/09.

Identical sample organic and conventional: Organic total output increased by 20%, conventional up by 25% in 2008/09, both as a result of increased milk prices, yields falling slightly. Inputs also increased substantially, (up by around 20% for both organic and conventional, with organic feed costs up by 39%, conventional up by 32%, with most other costs similar except for land and rent that increased, and a slight reduction in labour costs on organic farms.

Figure 7 LFA dairy farm outputs (£/ha, Identical samples, 2007/08 and 2008/09)

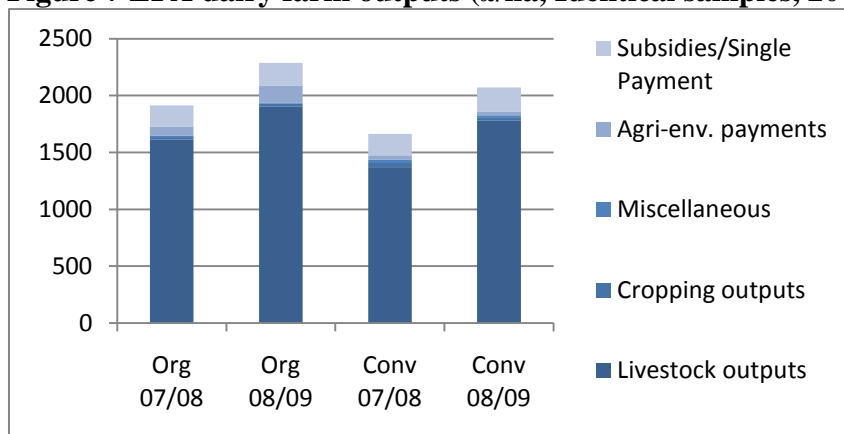

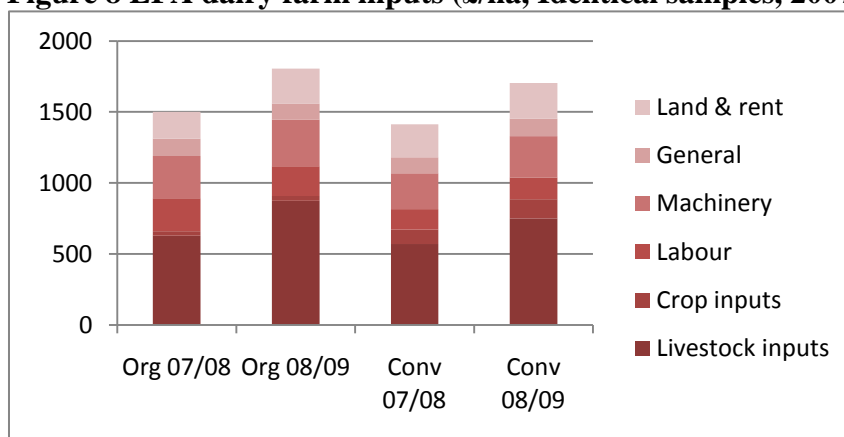

Figure 7 shows increased output for both sectors, mainly due to increased livestock outputs. Figure 8 highlights a large increase in both organic and conventional inputs, due to increased livestock inputs, land and machinery costs

Figure 8 LFA dairy farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.7 Lowland dairy farms

For detailed results see Appendix 1, Table A5, page 80.

Data from thirty one organic lowland dairy farms have been used for the two year comparison of identical farms where one farm was the North-West, two in Yorkshire and Humber, three in East Midlands, five in West Midlands, two in the South-East, fourteen in the South-West and four in Wales. In total, the full sample of lowland organic dairy farms amounted to forty four farms in 2008/09.

Farm Business Income	439	486	450	579	538	491	482	553

Full sample organic and conventional: Average organic farm size was approximately 8% larger, whilst the business size was 5% smaller. Annual labour units utilised were slightly lower on the organic farms at 3.0ALU/farm, conventional at 3.2ALU/farm and for labour per 100ha, organic was 2.4ALU, conventional was 2.8ALU/100ha. The organic stocking rate at 1.4LU per effective hectare was equivalent to 88% of the conventional farms, the conventional units having a higher forage stocking rate of 1.8GLU/eff. forage ha, organic at 1.4GLU/eff. forage ha.

Total outputs were 6% lower on the organic farms, however organic farm output from milk production was higher than conventional at £1833/ha with an average milk yield of 5808 litres and a milk price of 32.7ppl. Conventional milk yield was 17% higher at 6788 litres, however the milk price was 7ppl (21%) lower at 25.7. Conventional cropping output was higher, reflecting the greater area grown, whilst other revenue sources were similar for both samples, though organic farms received around three times the level of agri-environmental payments.

Input costs were similar across both sectors, though organic feed costs were higher, whilst conventional crop costs were higher due to the larger area grown. Overall, the full sample of farms for 2008/09 indicated an identical NFI between the two farming types, though the conventional FBI

was 15% higher. The return on tenant’s capital was 21% for the organic full sample while the conventional farms returned 16% for this financial period. Returns to total labour units used for the identical samples were £25,588 for the organic farms and £21,742 for the conventional farms based on NFI and labour calculations in 2008/09.

Identical sample organic and conventional: Output increased for both farm types in 2008/09, organic output rising 14%, conventional up 16%, mainly due to improved dairy and other cattle returns. However the level of input costs also continued to increase up 19% and 18% for organic and conventional respectively. Organic NFI increased slightly, conventional NFI increasing by 21%. The return on tenant’s capital for the identical sample of organic farms fell by 32% to 17.5%, the conventional sample also falling slightly to 15.4% in 2008/09.

Figure 9 Lowland dairy farm outputs (£/ha, Identical samples, 2007/08 and 2008/09)

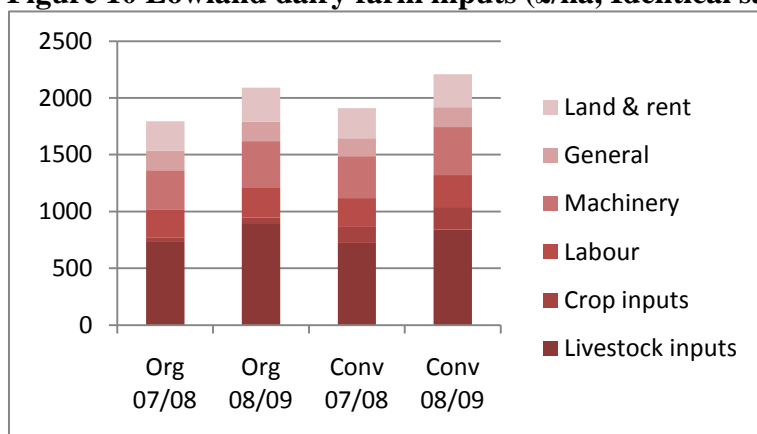

Figure 9 shows increased output for both sectors, mainly due to increased livestock outputs. Figure 10 highlights a large increase in both organic and conventional inputs, due to an increase all inputs.

Figure 10 Lowland dairy farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.8 LFA cattle and sheep farms

For detailed results see Appendix 1, Table A6, page 88.

Data from thirty seven organic LFA cattle and sheep farms have been used for the two-year comparison where five farms were located in the North-East, four in North-West, one in Yorkshire and Humber, one in East Midlands, one in West Midlands, four in South-West and twenty one in Wales. In the 2008/09 dataset, there were a total of thirty nine organic LFA cattle and sheep farms in the full sample.

Farm Business Income	266	154	261	206	276	145	258	199

Full sample organic and conventional: Average organic farm size was slightly larger than conventional, whilst business size was almost identical. Both organic and conventional farms carried around the same level of stock, with stocking at 0.9LU/effective ha on organic, 1.0LU/eff. ha on conventional. Cattle represented 52% of the stock carried on the organic farms, compared with 46% of stock on the conventional farms on a livestock unit basis. Sheep mostly made up the remainder of stock carried for both farm samples, although the conventional farms on average carried greater breeding ewe numbers than the organic farms. Annual labour units were similar for both organic and conventional farms at 1.7 ALU/farm, organic labour per 100ha was slightly lower than conventional at 1.2ALU and 1.3ALU/100ha respectively.

Total organic outputs were slightly higher than for the conventional farms, with lower livestock outputs, but superior agri-environmental payments, which accounted for 19% of total organic output in 2008/09, compared with 10% of total conventional output. Organic finished beef averaged £875/head, conventional at £856, organic finished lambs averaged £54/head, conventional at £50/head.

Organic input costs were 7% lower than conventional, with most individual costs at similar levels, organic farms making slight savings with livestock costs. Crop inputs on the conventional farms remained significantly higher than on the organic farms, reflecting in part the lower use of fertilisers and sprays by the organic businesses.

The organic NFI was 58% higher than the conventional figure; the organic FBI 30% higher. In 2008/09, the organic return on tenant’s capital was 12.2%, conventional at 1.1%, whilst return to total labour units were £18,788/ALU on the organic farms and £10,476/ALU for the conventional farms based on NFI and labour calculations.

Identical sample organic and conventional: From 2007/08 to 2008/09, the organic farm output increased around 5%, while conventional output climbed by 17%. Organic livestock outputs were slightly higher, conventional farms up by 31%. Cattle prices were higher than the previous year, with finished organic cattle prices around 4% higher, conventional 22% higher, with sheep prices improving considerably for both sectors, organic lamb up 12%, conventional up 29%. Overall, Figure 11 shows that support payments made up 44% of organic and 39% of conventional farm income in 2008/09, reduced from 2007/08 due to increased overall income. In 2008/09 the organic identical sample NFI decreased by 5%, while conventional NFI improved by 61%, but remained below the organic level. Farm business income (FBI) showed a similar trend, with organic remaining similar and conventional increasing.

Figure 11 LFA cattle and sheep farm outputs (£/ha, Identical samples, 2007/08 and 2008/09)

Figure 11 shows increased output for both sectors, mainly due to increased livestock outputs, but highlights the reliance of both systems on support payments for income.

Figure 12 highlights a modest increase in both organic and conventional inputs, mainly due to an increase in livestock and machinery costs.

Figure 12 LFA cattle and sheep farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.9 Lowland cattle and sheep farms

For detailed results see Appendix 1, Table A7, page 96.

Data from twenty six organic lowland cattle and sheep farms have been used for the two-year comparison where one farm was located in the North-East, three in East Midlands, two in West Midlands, one in the East, four in South-East, eleven in South-West and four in Wales. In the 2008/09 dataset, there were thirty three organic lowland cattle and sheep farms in the full sample.

Farm Business Income	163	101	176	150	176	106	158	195

Full sample organic and conventional: Average farm size was 11% greater for the organic farms compared to the conventional farms whilst business size was almost identical. Stocking rates are very similar, organic at 0.9LU/eff. ha, conventional at 1.0LU/eff. ha. The proportion of organic cattle and sheep at 74:26 is slightly higher when compared to the conventional farms where the proportion of cattle and sheep is 67:33. Annual labour use was identical at 1.5 ALU/farm for both farm types, though organic was lower per 100ha at 1.3ALU, conventional at 1.5ALU/100ha.

Total output was 13% lower for the organic than the conventional sector; with 27% lower livestock output, despite organic prices averaging 9% higher for finished cattle and 22% higher for finished lambs. Organic farms also had a 52% lower cropping output, though agri-environment payments were over three times greater.

Conventional inputs were 18% higher than organic, mainly due to greater livestock and crop inputs as other costs were similar. In particular, conventional feed costs were higher to achieve greater output, and yet overall organic NFI is slightly higher than conventional. Conventional FBI is however 23% higher than the organic level.

In terms of returns on tenant’s capital, the organic farms showed a return of 0.7%, while the conventional farms showed a return of -1.9%. Returns to total labour units used for the organic sample was £10,349/ALU and £8,882/ALU for the conventional farms.

Identical sample organic and conventional: The average identical sample organic farm output improved by 9%, with improved returns in all but cropping output in 2008/09. Conventional farms improved by 17%, with a 40% livestock output gain. Organic farms continued to receive higher agri-environmental payments representing 17% of total organic output, and 5% of conventional total output in 2008/09. Input costs increased in 2008/09 compared to the previous year for both sectors, with all organic inputs increasing, conventional costs up by 10%. Both livestock and crop inputs on the conventional farms remained significantly higher than on the organic farms, reflecting in part the lower use of external inputs by the organic businesses. Overall, identical sample organic net farm income (NFI) increased by 19%, and conventional NFI improved by almost 200% in 2008/09. FBI increased for both farm types, organic remaining ahead of the conventional sample.

Figure 13 Lowland cattle and sheep farm outputs (£/ha, Identical samples, 2007/08 and 2008/09)

Figure 13 shows increased output for both sectors, due to increased livestock outputs and support payments, and highlights that lowland systems are also very reliant on support payments for income.

Figure 14 highlights small increases in both organic and conventional inputs, mainly due to an increase in livestock and machinery costs.

Figure 14 Lowland cattle and sheep farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

2.10 Mixed farms

For detailed results see Appendix 1, Table A8, page 104.

In total, there were nine mixed organic farms in the two year identical farm comparison. One farm was classified as cropping and dairy, eight were cropping, cattle and sheep, one as cropping pigs and poultry and two as mixed livestock farm types. The two year comparison of identical farms comprised two farms in North-East England, two in East Midlands, two in West Midlands, one in the South East, two in South West and three in Wales. The full sample comprises nineteen mixed farms, (two cropping and dairy, thirteen cropping, cattle and sheep and two cropping, pigs and poultry type and two mixed livestock type farms).

Farm Business Income	265	211	312	202	297	219	314	229

Full sample organic and conventional: Average farm size was slightly greater for the organic farms with similar business size. Land utilisation varied between sectors, with the organic farms at 25% of land as cropping, conventional farms at 35%, though organic farms had a higher percentage as peas/beans/linseed (13% vs. 4%). Stocking rates were similar, with both at 0.9LU/eff. ha, with cattle representing between 62 and 64% of stock on both types, sheep less important to organic units that have greater levels of pigs and poultry than the conventional farms. Labour use was similar per farm at 2.4 and 2.5 labour units for the organic and conventional farms, respectively, though organic labour use per 100ha was lower at 1.4ALU for organic and 1.7ALU/100ha for conventional.

Organic output was 8% below conventional, with 3% lower livestock output, 30% lower cropping, 53% miscellaneous income, but 1.6 times higher agri-environment payments. Overall, livestock represented 45-48% of total output with cropping output more important to the conventional group. Organic finished cattle prices were 10% higher than conventional at £881/head though lambs were

identical at £55/head. Organic wheat yields were 45% lower at 4.2t/ha, barley 48% lower at 2.9t/ha, though wheat prices were 87% higher at £200/t, barley was 36% higher at £144/t.

Organic inputs were only 81% of the conventional level, with livestock inputs 23% lower and cropping inputs 55% lower. Fixed costs were generally lower for organic farms, and despite lower output, the organic NFI was 65% higher than the conventional farm sample. Organic FBI was 37% higher than the conventional level, with organic farm return on tenant’s capital of 13% and 4% for the conventional sample. Returns to total labour used were £24,954 for the organic farms and £14,441 for the conventional farms in 2008/09 based on NFI and labour calculations.

Identical sample organic and conventional: Total organic output increased by 13%, conventional output was up by 7% in 2008/09. Both sectors showed improved livestock output, but lower cropping output in 2008/09, whilst agri-environment payments are affected by a single farm. Prices for both organic and conventional wheat decreased in 2008/09, organic by 12%, conventional by 28%, whilst yields improved for both.

Input costs increased by 10% for both sectors, (as shown in Fig. 8 below), organic due to increased cropping, labour and machinery costs, conventional due to rising livestock, cropping and machinery costs. Overall, the identical sample organic NFI improved by 21% and was 8% lower for the conventional farm sample, with a similar pattern for FBI.

Figure 15 Mixed farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

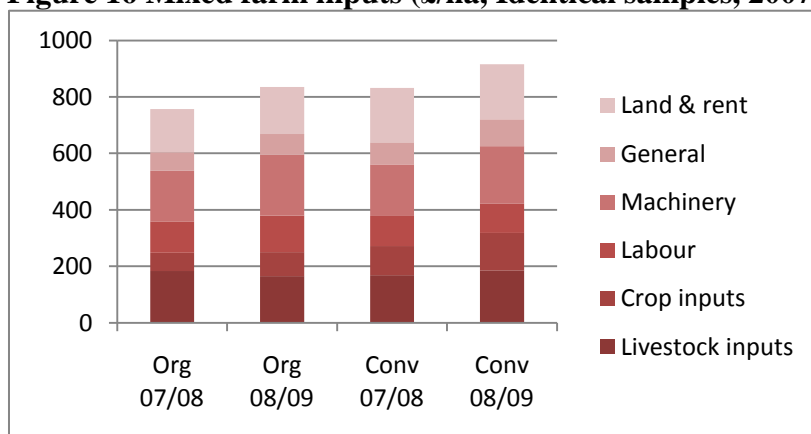

Figure 15 shows a modest increase in organic output, with increased livestock and support payments, but lower cropping output, whilst conventional farms increased output slightly. Figure 16 highlights increases in both organic and conventional inputs, organic due to increased costs for all inputs except livestock costs, conventional farms seeing increases in all costs except labour.

Figure 16 Mixed farm inputs (£/ha, Identical samples, 2007/08 and 2008/09)

3. Enterprise gross and net margins

Tables 12 to 16 show gross margin results for selected organic livestock and crop enterprises for 2008/09 and 2007/08, with comparative conventional data shown where available. (Data is only identically matched over two years for dairy production in Table 12). Gross margin figures are for certified organic enterprises, but may include some livestock/crops sold at conventional prices. Arable benchmark costs of production are included in this section as the results are derived from the gross/net margin data based on achieved yields. Not all crop results are shown due to small samples.

All gross margin data have been calculated as simple averages. Crop outputs include revenue and imputed values for farmhouse consumption, feed used on farm and a closing valuation for any unsold crop. It should be noted that feed values and closing valuations may be undervalued (i.e. not valued at achievable organic premium prices) in the recording process – however, this will also be reflected in lower costs for the livestock enterprises where home-grown feed is used.

Estimated net margins including allocated fixed and imputed costs are also shown. These costs are allocated pro rata based on the number of livestock units (LU) and the land area allocated to individual enterprises. The imputed costs cover unpaid labour (based on standard rates for hours input) as well as rental value for owner occupied land and interest on tenant-type capital adjusted for actual interest payments. This ensures that the costs of the farm-family's own labour, land and capital resources used in the business are accounted for. Please also note the methodological change in the 2008/09 FBS year with the introduction of a different allocation and apportionment model than had previously been used for determining the notional fixed costs attributable to agriculture, diversified enterprises, single payment scheme and agri-environment scheme. Hence, the fixed costs cannot be compared directly with those from 2007/08 due to this methodological change. Readers can access full details of this methodological change at https://statistics.defra.gov.uk/esg/asd/fbs/sub/fbs_comm.htm.

Table 12 presents an identical sample of 35 organic and 93 conventional dairy net margins over two years, and showed that over two years organic output increased by 12%, but total costs were also up by 10%, the organic sample achieving a net margin over all costs (including imputed) of £82/cow. The conventional sample improved output by 22%, but costs were also up by 14%, achieving a net margin over all costs of £94/cow in 2008/09.

Table 13, contains results for a sample of 49 organic dairy enterprises, and 171 conventional enterprises (from clustered conventional farms within whole farm analysis). The organic farms achieved over 6% higher output, mainly due to a 30% higher milk price at 33.4ppl, and despite a 17% lower milk yield than conventional. Some organic costs were higher, notably feed (17%) and labour (63%), while forage was much lower (64%), with total costs (including imputed) 9% higher. Overall, the full sample dairy net margin figures showed a higher organic gross margin of £1,049/cow, conventional at £965/cow, but an organic overall net margin over all costs of £48/cow, 42% lower than the £83/cow achieved by the comparable conventional units.

Table 14 shows organic cattle net margin data, output increasing by around 0 to 6%, but costs also increased leading to a limited improvement. The organic sheep net margin data in Table 15 highlights an improvement of between 8 to 25% in output, but also increased LFA costs, resulting in little change. Both cattle and sheep margin data highlights the high costs of production compared to the price achieved for stock, and therefore reliance on support payments for farm profitability.

Table 16 presents crop gross and net margin data. Organic crop gross and net margins were generally similar in 2007/08, with yields generally higher though prices were lower. Organic gross margins are often superior to conventional, though net margins were more variable, (mainly due to higher organic fixed costs in many cases). The small sample of horticultural net margins highlight the high costs and high returns involved, and still showed a positive net return.

Table 12 Identical sample organic and conventional dairy gross and net margins (£/cow), 2007/08 and 2008/09

Herd characteristics Year	Organic		Conventional**		Herd characteristics Year	Organic		Conventional**

4. Benchmark costs of production

Tables 17 to 22 show costs of production data for organic milk, beef and lamb production (crop production costs are shown in Table 16 in the previous section).

Table 17 shows the organic and conventional dairy full sample average data for 2008/09, top 5 organic (ranked by lowest costs) results in 2008/09 and organic whole sample average data for 2007/08. Table 18 shows the dairy costs of production for an identical sample of organic and conventional farms in 2007/08 and 2008/09. (Conventional data is taken from clustered conventional dairy farms utilised within the whole farm section of this report).

Under the existing data collection system for England it is no longer possible to obtain the sale/transfer weights needed to calculate costs of production for beef and lamb. Tables 19 to 22 are therefore for Welsh farms only, using data collected separately by the Farm Business Survey Unit, IBERS within Aberystwyth University. The comparable conventional farm data represents results for all farms for which costs of production data were collected. The clustering approach used for selecting comparable conventional farms for the whole-farm data presented in this report could not be used in this case.

The cost of production data are calculated according to standard procedures whereby the variable costs relate to actual enterprise costs while the forage costs are apportioned according to the weighting of the livestock enterprise on the basis of livestock units associated with each livestock enterprise. This method is also carried out for allocating the fixed/overhead costs and other outputs, except that there is a further adjustment to account for the weighting of any arable enterprises within the whole farm system. Here, values are allocated on the basis of livestock units and the percentage area that is utilised by the livestock enterprises as a whole. This method assists in preventing the allocation of arable costs to the livestock enterprises. All outputs and costs are then divided by the unit of production (litres for milk, kg liveweight for stores and deadweight for finished beef and lamb production).

To fully reflect costs and put businesses on a comparable basis with respect to use of own labour, land and capital resources, imputed values are estimated for unpaid labour (farmer/spouse/other), interest on the farmer's share of tenant's capital (the total on-farm value of buildings, machinery, livestock and milk quota calculated at an interest rate of 6%) and imputed rent (rental value of owner occupied land excluding buildings). These costs are allocated on the same basis as for other fixed costs described above.

Please note the methodological change in the 2008/09 FBS year with the introduction of a different allocation and apportionment model than had previously been used for determining the notional fixed costs attributable to agriculture, diversified enterprises, single payment scheme and agri-environment scheme. Hence, the fixed costs cannot be compared directly with those from 2007/08 due to this methodological change. Readers can access full details of this methodological change at https://statistics.defra.gov.uk/esg/asd/fbs/sub/fbs_comm.htm.

Organic variable costs are often lower than conventional due to a lower level of input usage, though fixed costs are often higher per unit of production due to lower production overall to spread these costs. (Whole farm data, presented elsewhere in this report does not show a strong pattern of organic farms having higher fixed costs). Although the total cost of production is often higher on organic systems these are usually off-set by higher levels of support payments.

4.1 Dairy enterprise production costs

The costs of production results for England and Wales shown in Table 17 are taken from 49 dairy farms in 2008/09, (up from 38 in 2007/08).

The main physical differences between the top 5 (rank by lowest costs) and average groups for 2008/09 included a slightly smaller herd size as well as substantially higher average milk yields per cow at 7795 litres per cow compared to 5753 litres for the average group. Feed costs were almost identical though other costs and especially labour were lower for the best performers, with total costs (including imputed costs) at 27.6 pence per litre and 31.7 pence per litre for the average group. The net margin of production including imputed costs was 7.8 ppl for the top 5 group, more than twice the average value of 2.9 ppl.

Table 18 presents an identical organic and conventional sample over two years and highlights a 7% organic milk price increase, rising to 31.8ppl, conventional prices also increasing, by 20%, but remaining considerably lower at 25.1ppl. Figure 17 highlights that identical sample organic concentrate costs have risen 18%, conventional by 28% in 2008/09. Overall, total organic costs increased by 8%, conventional up by 16%.

Figure 17 Organic and conventional dairy costs of production (Identical sample, 2007/08 and 2008/09)

The Welsh dairy farm costs of production data from a sample of 8 farms is shown in Table 19, indicating the organic milk yield was only 3% below the conventional level of performance in terms of yields per cow, and equal yield per hectare. Total organic costs of production (including imputed) were 28.4ppl, dairy output of 33ppl, and an overall enterprise net margin of 4.6ppl (including imputed costs and excluding support payments).

4.2 Beef enterprise production costs

Table 20 and Table 21 show the average cost of production data for both suckler store and finishing beef production enterprises, from 22 and 16 Welsh organic farms respectively. The top and bottom third groups are classified by net margin per kg output.

Suckled stores: Table 20 shows the organic suckler system was minus 499p/kg liveweight (LW) in 2008/09, a 22% decrease on 2007/08, and still considerably behind conventional farms that averaged -359p/kg LW. The top third producers reduced this deficit to minus 243p/kg LW. The negative net margins are partly caused by the relatively low value applied to weaned organic calves, and to some extent, the single farm payment and support payment income offset these losses, as the average margin including support payments is much improved to a positive 175p/kg LW. It is clear however that prices received are still considerably lower than covering the full costs of production. In comparison with conventional store production organic producers have similar output and variable costs, lower forage costs but over 50% higher than conventional fixed costs (as highlighted in Figure 18 below).

Figure 18 Organic and conventional breeding and finishing beef costs of production, 2008/09 (Breeding p/kg LW, Finishing p/kg DW)

Finished beef: Table 21 indicates the finishing beef enterprise recorded data. The organic margin over costs, including imputed is negative but by a greater amount than for stores, averaging minus 489p/kg deadweight (DW) for all herds and minus 286p/kg DW for the top third group, representing a 7% and 5% decrease respectively upon 2007/08. Again, this deficit is offset by the single farm payment and other support payment income. The average margin including support payments was 353 p/kg DW; reflecting the substantial reliance on support payments for overall farm income. When compared with conventional production the organic samples show a 9% lower output but 6% lower variable and 34% lower forage costs, while fixed costs are 48% greater. Overall, net margin is 23% higher due to greater support payments per kg.

4.3 Lamb enterprise production costs

The costs of production data for lamb production in Table 22 are taken from 24 organic farms in 2008/09 and conventional results for the same periods are shown for comparison.

The top third producers (highest net margin per kg of production), tend to have smaller flocks, but with higher stocking rates both years and considerably lower fixed costs. Overall, the top performers had lower variable and fixed costs, but higher forage and imputed costs in 2008/09, resulting in a greater margin over production costs. The lower costs of production for this top third group can be partly explained by the top third producers consistently producing more kilograms of lamb per ewe, which dilutes costs on a p/kg deadweight basis and selling their lambs at a higher price per kilogram.

Figure 19 Organic and conventional lamb costs of production, 2008/09 (p/kg DW)

The net margin including imputed costs, which reflect the value of the farmer’s own land, labour and working capital, indicate that both the average and top third groups had a negative overall margin of production for lamb production, at minus 335p/kg DW and 281p/kg DW, respectively. However, with the inclusion of the single farm payment and other area payments, the margin of production was 202p/kg DW for the average group and 544p/kg DW for the top third group, conventional producers averaging 5p/kg DW in 2008/09.

As with beef systems, both organic and conventional systems continue to rely heavily upon support payments for overall farm profitability. Each average organic lamb kilogram, is costing 643p to produce (including imputed costs), and receiving payment of 296p/kg from processors.

Appendix 2 The farm classification system

For each farm in the survey, each hectare of crop area and each head of livestock are assessed in terms of Standard Gross Margins (SGMs). These SGMs are expressed in European Currency Units, with 1200 such units equivalent to 1 European Size Unit (ESU).

Farm size is measured for a particular farm by the number of ESUs registered in total, and this is thus a measure of the size of the farm business. It is a measure of the economic size of businesses in terms of the value they add to variable inputs and thus differs from physical measures, such as area, which take no account of the intensity of production. The survey is designed to cover farms of at least 8 ESU in size.

Farm type is determined for a particular farm by the proportion of the SGM total accounted for by each enterprise. Precise details of the typology are complex, but may be summarised as follows:

<i>Farm type</i>	<i>Characteristics</i>
Cropping	In this report, two categories are combined:
<i>Cereals</i>	Farms on which cereals and other crops generally found in cereal rotations account for more than two thirds of their total SGM.
<i>General cropping</i>	Farms on which arable crops (including field scale vegetables) account for more than two thirds of their total SGM excluding farms classified as <i>cereals</i> .
Horticulture	Holdings on which fruit (including vineyards), hardy nursery stock, glasshouse flowers and vegetables, market garden scale vegetables, outdoor bulbs and flowers, and mushrooms account for more than two thirds of their total SGM.
Poultry	Farms where poultry account for over two thirds of total SGM.
Dairy	Farms where the dairy enterprise, including followers, accounts for over two thirds of the total SGM. A holding is classified as a Less Favoured Area (LFA) holding if 50% or more of its total area is in the LFA.
LFA Cattle and Sheep	Farms in the LFA on which cattle, sheep and other grazing livestock, other than dairy cattle account for over two thirds of total SGM. Includes holdings classified as Severely Disadvantaged Area (SDA) if land is 50% or more within the SDA, and Disadvantaged Area (DA), if land is more than 50% within the DA.
Lowland Cattle and Sheep	Farms outside the Less Favoured Areas on which grazing livestock, other than dairy cattle, account for over one-third, commonly over two-thirds, of total SGM, and form the largest enterprise group, or farms on which grazing livestock (except dairy cattle) and field crops each account for over one-third but less than two-thirds of total SGM.
Mixed	Includes mixed pig and poultry farms as well as farms with a mixture of crops and livestock, not classified elsewhere due to their mixed status.

Appendix 3 Definition of terms and abbreviations

Breeding Livestock Appreciation (BLSA)

BLSA is that element of Net Farm Income resulting from changes in breeding livestock prices between the opening and closing valuations. It is calculated by multiplying for each category of breeding livestock the change in the opening and closing valuations by the average number of livestock in that category during the year.

Cash Income

Cash income is based on actual receipts and actual expenditure. It represents the difference between receipts and expenditure on current account, before depreciation charges and investment spending.

Effective Hectares (Eff. ha)

The effective hectares constitutes the total farm area minus the area occupied by roads, woodland, wasteland and buildings, and with rough grazing expressed in terms of their pasture equivalent. E.g. on a particular farm, 20 hectares of rough grazing in terms of its capacity to carry stock may be worth 4 hectares of permanent pasture - it is therefore regarded as being 4 effective hectares. A notional area is also estimated for the use made of any common grazing.

Enterprise Output

Enterprise output is all returns from an enterprise, plus the market value of any of its products transferred out to another enterprise, plus the market value of any production from the enterprise given to workers or consumed on the farm. In the case of livestock enterprises, the value of purchased livestock and the market value of livestock transferred in from another enterprise are deducted. All totals are adjusted for changes in valuation. Milk output includes quota transactions and any super-levies paid, have been deducted.

General Farming Costs

General farming costs include electricity, water and telephone charges, licences, insurances, subscriptions, professional charges, etc.

Farm Business Income

Farm Business Income (FBI) represents the return to all unpaid labour (farmers, spouses and others with an entrepreneurial interest in the farm business) and to all their capital invested in the farm business including land and farm buildings. It is defined as Total Farm Output (TFO) plus profit/loss on sale of assets minus cost (C), where: TFO is defined as the sum of output from: crop enterprises, adjustment for disposal of previous crops, livestock enterprises, separable non-agricultural diversification, single farm payment, agri-environmental payments, other grants and subsidies, miscellaneous receipts; C is defined as variable costs plus fixed costs.

Livestock Units (LU) and Grazing Livestock Units (GLU)

Livestock numbers are converted to livestock units, which are based on estimated energy requirements, in order to calculate the total stocking of grazing livestock on the farm. The following conversion factors are used:

Dairy cow	1.00	Hill ewe	0.06
Beef/hill cow	0.75	Upland ewe	0.08
Beef/dairy bull	0.65	Lowland ewe	0.11
Beef/dairy heifer	0.80	Ram	0.08
Other cattle – 2 years old and over	0.80	Ewe lamb	0.08
- 1 to 2 years old	0.65	Other sheep 1 year old and over	0.08
- under 1 year old	0.34	Store lamb under 1 yr.	0.04

Margin over concentrates

Margin over concentrates is the difference between milk sales and the value of purchased and home grown concentrates used for the dairy herd.

Miscellaneous Output

Miscellaneous output includes contract work, farm cottage rents, benefit value of farmhouses, and profit on resale of purchased agricultural produce.

Net Farm Income (NFI)

NFI is total farm enterprise output less total inputs (excluding the value of the labour of the farmer and spouse). It is calculated as if all farms are tenanted, and represents the return to the farmer and spouse for their labour and management, and on the tenant-type capital of the business.

Net Worth

Net worth is the difference between total assets and total liabilities and represents the value of assets available to the business, all other claims against these assets having been met.

Occupier's Net Income

Occupier's net income is based on actual tenure and indebtedness. It represents the return to the farmer and spouse for their labour, management and investment in the farm business.

Other Crop Costs

Other crop costs include crop protection chemicals and other costs incurred specifically for crop enterprises and forage.

Other Livestock Costs

Other livestock costs include purchased bedding materials, and other costs incurred specifically for livestock enterprises.

Owner Equity

Owner equity is net worth expressed as a percentage of total assets.

Rental Value

For owner-occupied farms, a rental value is imputed to make it possible to compare results with farms on which rents have to be paid.

Return on All Capital

Return on all capital is management and investment income plus rental value expressed as a percentage of total capital.

Return on Tenant's Capital

Return on tenant's capital is management and investment income expressed as a percentage of total tenant's capital.

Tenant's Capital

Tenant's capital is the value of livestock, machinery, crops (including cultivations) and stores. In the tables, it is expressed as the average of the opening and closing valuations for these items.

Utilisable Agricultural Area

UAA is the land area that is actually farmed by the farmer excluding areas such as roads, farm yards, buildings woodlands, water or unused rough grazing.

Abbreviations used throughout text include:

ALU – Annual Labour Units

CCF – Comparable Conventional Farms

ESU – Economic Size Unit

FBI – Farm Business Income

FBS – Farm Business Survey

LFA – Less Favoured Area

LU – Livestock Unit

MII – Management and Investment Income

NFI – Net Farm Income

OFS – Organic Farming Scheme

SFP – Single Farm Payment

SGM – Standard Gross Margins

UAA – Utilisable Agricultural Area

Appendix 4 Numbers of farms to be sampled/recruited by type and region

The recruitment targets set in 2006/07 were based on an analysis of registered organic businesses in 2005, classified by farm type and GOR, and have been maintained into 2008/09. The guideline target samples try to ensure that the population distribution is reflected. To increase the useable data, new businesses recruited should have more than 70% fully organic land.

For England from 2006/07, it was agreed with Defra that guidelines for a minimum of 140 farms (70 in the main FBS and 70 from the supplementary data collection covered by this project) should provide for a minimum of 6 in each type category (see table), except:

- a) In the case of the LFA (DA & SDA) cattle and sheep categories, as these can be combined with each other and with Welsh data to achieve the 5 minimum.
- b) Horticulture, where the priority should be to achieve a minimum of 6 each 'small-scale market garden' and 'larger scale field vegetables' within the other horticulture category. If recruitment enables the specialist glass and fruit categories to be increased to 5 or 6, that would be welcome, but was not a requirement.
- c) Specialist horses and pigs, where the organic population is too small.

For Wales, the recruitment priorities identified, taking account of the existing samples, are:

- a) Improve balance between LFA and lowland dairy if any lowland dairy farms drop out
- b) Recruit horticultural businesses if any cropping or mixed farms drop out
- c) Maintain current lowland cattle and sheep numbers
- d) Focus on recruiting LFA (DA) cattle & sheep businesses.
- e) Within the SDA groups, cattle and sheep businesses are over-represented, and specialist sheep are underrepresented, so if any drop out of the former, they could be replaced by the latter if possible.

Appendix 5 Organic and conventional farm comparisons

A key aspect of this research work was to derive a cluster of similar conventional farms for each organic farm to provide comparison data. By generating comparison farm data, it is possible to determine and understand further the economic performance of organic farms, their relative competitiveness and the impact of policy on them in relation to conventional farms.

5.1.1 Background

Issues relating to comparing results from organic and conventional farms have been discussed by Lampkin and Padel (1994)⁵ and Offermann and Nieberg (2000).⁶

The conventional farms selected need to be ‘comparable’. The objective is to isolate the effect of the farming system on profits, so the choice of characteristics for comparison must be restricted to ‘non-system determined’ factors, i.e. location (climate, topography, soil, and market distance), size and tenure. The use of clusters of similar conventional farms to compare with each organic farm has the advantage over paired farm comparisons in that specific circumstances of individual conventional farms do not distort the comparison. The average for a group of organic farms can then be compared with the average for the group of matched clusters with greater confidence when the farm size, type and location characteristics of the organic and conventional groups are similar.

The idea of using clusters of conventional farms for comparisons has been carried out before (Fowler et al., 1999)⁷, using a hierarchical cluster analysis technique on the basis of Euclidean squared difference; however, the method of clustering has been changed in this study.

5.1.2 Conventional farm selection

For each organic farm recorded, the aim was to generate a cluster of at least three comparable conventional farms (CCF) from the Farm Business Survey database (Defra, 2007)⁸. The emphasis for selection of comparable conventional farms for this study was to focus on resource endowment identifiers/variables. The resource endowment of the business is normally independent of the organic or conventional management, and is a reflection of the resources with which the farm manager can run the farm business.

The main identifiers required to be identical for determining resource endowment include:

- Region (FBS province) - assists with selecting farms with similar production conditions (i.e. location, market distance, institutional and policy frameworks);
- Less Favoured Area and Non- Less Favoured Area status (See Table A9);
- Altitude (See Table A10);
- Main farm type, which is more descriptive typing than robust type (see Table A11).

Table A10 Recoding of LFA codes to simplify the clustering procedure

Less Favoured Area Codes		LFA types
All land outside LFA	1	1
All land inside severely disadvantaged area (SDA)	2	2
All land inside disadvantaged area (DA)	3	
50%+ in LFA of which 50%+ in SDA	4	3
50%+ in LFA of which 50%+ in DA	5	
<50%+ in LFA of which 50%+ in SDA	6	4
<50%+ in LFA of which 50%+ in DA	7	

Table A11 Altitude codes for farms in the FBS/FADN system

Altitude Description	Code
Most of business below 300m	1
Most of business at 300m to 600m	2
Most of business at 600m or above	3

Table A12 Main type and robust types used in the FBS/FADN system

Farming Description	Main type	Robust type
Cereals	1	Cropping
General cropping	2	
Specialist fruit	3	Horticulture
Specialist glass	4	
Specialist hardy nursery stock	5	
Other horticulture	6	
Specialist pigs	7	Pigs and poultry
Specialist poultry	8	
Dairy (LFA)	9	Dairy
Dairy (lowland)	10	
Specialist sheep (SDA)	11	LFA cattle and sheep
Specialist beef (SDA)	12	
Mixed cattle & sheep (SDA)	13	
Cattle & sheep (DA)	14	
Cattle & sheep (lowland)	15	Lowland cattle and sheep
Cropping and dairy	16	Mixed
Cropping, cattle & sheep	17	
Cropping, pigs & poultry	18	
Cropping & mixed livestock	19	
Mixed livestock	20	

To prevent limiting the number of CCFs unduly, the above variables were reassigned different codes to allow some flexibility in deriving the comparison farm data.

To identify comparable farm data with similar resource endowment, pre-defined ranges were used for land (UAA), milk quota ownership (dairy farms only), proportion of permanent pasture and rough grazing land, and the farm business size in standard gross margins (ESU) per farm. The range was defined by a percentage deviation from the value of the respective organic farm (e.g. +/- 20%) and/or an absolute value to prevent organic farms with small values being lost from the sample. Overall, the combination of variables for deriving farm clusters can be taken as a reasonable guide to identifying comparable resource endowment.

For all farm types, a standard procedure was undertaken to determine the comparable data selection per organic farm. However, it was not possible to achieve a reasonable number of CCFs in 33% of cases. Therefore, a hierarchical clustering approach was used, by adding farms of the same type from adjacent regions and on occasion increasing the pre-defined ranges per farm type (See Box 1 and Table A13).

Box 1 Conventional farm selection procedure

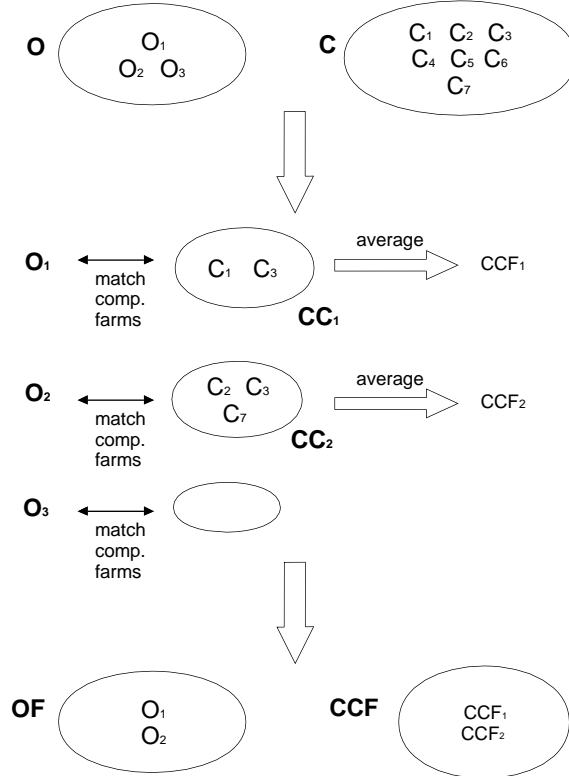

Farm business size, as measured by standard gross margins, is a measure of the potential economic activity of the particular mix and size of enterprises on the farm.

Table A13 Summary table to show the procedure used per farm type and the CCF results achieved (2008/09 farms)

	Cropping	Hort.	Poultry	Dairy		Cattle and sheep		Mixed	Total
	All			LFA	Lowland	LFA	Lowland		
Total organic farms	26	8	6	7	45	41	33	22	188
Baseline clustering criteria

Main type	identical	identical	identical	identical	identical	identical	identical	identical	
Region	identical	identical	identical	identical	identical	identical	identical	identical	
Utilisable agricultural area [UAA] (+/- %)	30	30	30	30	30	30	30	30	
Quota owned (+/- %)	n/a	n/a	n/a	30	30	n/a	n/a	30	
Permanent Pasture [PP] (+/- %)	30	30	30	n/a	n/a	30	30	30	
Rough Grazing [RG] (+/- %)	30	30	30	n/a	n/a	30	30	30	
Economic Size Units [ESU] (+/- %)	30	30	30	30	30	30	30	30	
No. of farms for which baseline cluster obtained (min 3 farms)	13	0	0	0	25	18	18	3	77
(as a percent)	50%	0%	0%	0%	56%	44%	55%	14%	41%
Modifications required to achieve clusters for remaining farms									
Main type (incorporate broader farm type definition)	2					5		2	5%
Regional (broader selection)	2	1	1	3	9	3	5	5	15%
Main type and regional (broader selection)	3	3			3	6	1		9%
Regional/main type and UAA/ESU/RG/PP (broader selection)	4	3	1		4	2			7%
LFA/altitude (non-identical criteria)						3	2	4	5%
Combination of above	1		4	4	3	2	7	5	14%
Not clustered	1	1			1	2		3	4%
Resulting final cluster statistics									
Average number of farms in cluster per organic farm	8.1	4.3	4	5.6	6.8	6.7	6.8	5	5.9
No. of organic farms with 5 or more farms (CCF) per cluster	13	2	2	4	29	23	20	7	100
% of organic farms with 5 or more farms (CCF) per cluster	52%	29%	33%	57%	66%	59%	61%	37%	56%
Range of CCF per organic farm per farm type: Minimum	3	3	3	3	3	3	3	3	3
Maximum	47	7	5	9	16	20	14	13	16

Once the comparable conventional farm data were identified from the main Farm Business Survey database (sample C in Box 2) and for the organic farms (sample O), the comparable conventional farm data for each cluster (CC_n) were averaged. This effectively creates a single ('artificial') comparable conventional farm CCF_n for each organic farm (O_n). Note that farms from sample C could be used more than once (in different clusters). All organic farms with no comparable data were removed from sample O, leaving set OF as the subset of sample O with matching clusters, and CCF as the set of averages for each cluster of non organic businesses drawn from sample C. The robust type comparative analysis presented in this report is based on average values for businesses matching the robust type criteria drawn from OF, compared with average values for their corresponding clusters drawn from CCF.

Box 2. Procedure for determining comparable farm data per farm type

5.1.3 Interpretation of results

As discussed earlier, the farms have been classified by Standard Gross Margins (SGMs), a typology system originally devised for conventional agricultural systems (see Appendix 2) and therefore not entirely appropriate for organic farms. Further, because of the systematic differences in structure on organic farms, clustering conventional farms is still only an approximate guide to the possible performance of organic farms if they were managed conventionally or vice versa.

The sample size for the comparison clusters is sufficiently large for a degree of confidence in the average value; however, there is still a possibility for outliers (especially larger farms) to have some disproportionate influence on the average.
