Camelina organic cultivation experiences in Italy

**Problem**

Soybean cake is a major source of protein in organic poultry diets. However, it does not contain the required levels of methionine and cysteine resulting in more soybean being fed to fulfill amino acids requirements, leading to higher costs and negative effects on animal health for overproteic diets.

**Solution**

To improve at the same time the crop rotation and the local production of feed-stuff with camelina (*Camelina sativa*). It is a low-requirement crop producing oil-rich seeds whose cake can contribute to protein supply.

**Benefits**

A complementary source of feed for poultry, rich in proteins and specifically in sulphur containing amino acids, as well as omega 3 fatty acids, as well as omega 3 fatty acids and tocopherols. A new crop to be included into Northern Italy crop rotations, fitting organic farming practices and diversification needs.

**Practical recommendation**

Camelina fits well into crop rotations on organic farms in North-Eastern Italy (Figure 1), as it can be sown in October and harvested in late May/beginning of June, so allowing a second crop, after it, of soybean.

It does not require high amounts of nutrients and, if it follows a cover crop with leguminous species or is sown in highly fertile soils, no specific inputs are required. No irrigation is needed. There are no diseases or pests affecting it. It is very resistant and will grow on marginal areas and sloping land.

It does not require specific machinery but, as the seed is extremely small (smaller than rapeseed), care at soil-bed preparation, drilling and harvesting is needed.

Key aspects for success:

- light soils with good drainage
- careful seed-bed preparation, seed should not be set deeper than 1 cm
- as the amount of seed per hectare is very small (about 7 kg depending on the variety) the seed drill should be appropriately set
- Camelina has a limited leaf development, that does not cover the soil, leaving space for weeds to grow (Figure 2). Preventative weed management methods should be applied, for example stale seed-bed technique (Figure 3). Besides it stand with no damage one or two passages of weeder harrow after the plants are established and before the weeds are too developed (in Northern Italy conditions in March).

OK-Net EcoFeed: This practice abstract was elaborated in the Organic Knowledge Network on Monogastric Animal Feed project. The project is running from January 2018 to December 2020. The overall aim of OK-Net EcoFeed is to help farmers, breeders and the organic feed processing industry in achieving the goal of 100% use of organic and regional feed for monogastrics.

Project website: ok-net-ecofeed.eu
Project partners: IFOAM EU Group (project coordinator), BE; Aarhus University (ICROFS), DK; Organic Research Centre (ORC), UK; Institut Technique de l’Agriculture Biologique (ITAB), FR; Research Institute of Organic Agriculture (FiBL), CH; Bioland, DE; Associazione Italiana per l’Agricoltura Biologica (AIAB), IT; Donau Soja DS, AT; Swedish University of Agricultural Sciences, SE; ECOVALIA, ES; Soil Association, UK.
