The compatibility of circularity and national dietary recommendations for animal products in five European countries: a modelling analysis on nutritional feasibility, climate impact, and land use

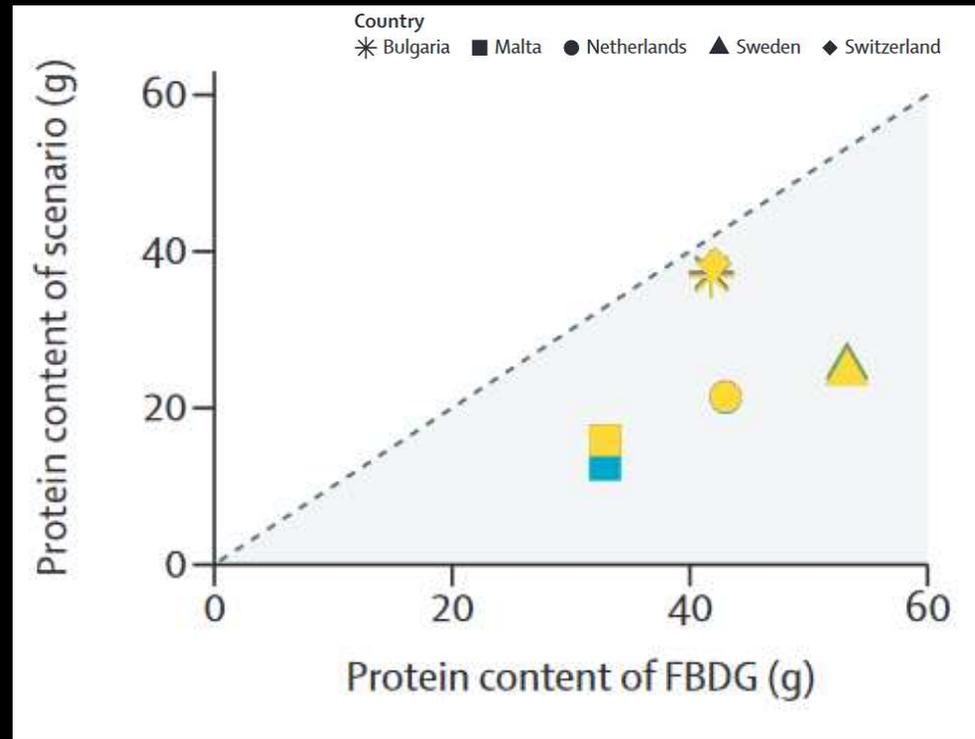

Anita Frehner, Renée P M Cardinaals, Imke J M de Boer, Adrian Muller, Christian Schader, Benjamin van Selm, Ollie van Hal, Giulia Pestoni, Sabine Rohrmann, Mario Herrero, Hannah H E van Zanten

Summary

National food-based dietary guidelines (FBDGs) are generally designed from a human health perspective and often disregard sustainability aspects. Circular food production systems are a promising solution to achieve

Organic farming is often considered a strategy that increases croplands' soil organic carbon (SOC) stock. However, organic farms currently occupy only a small fraction of cropland, and it is unclear how the full-scale expansion

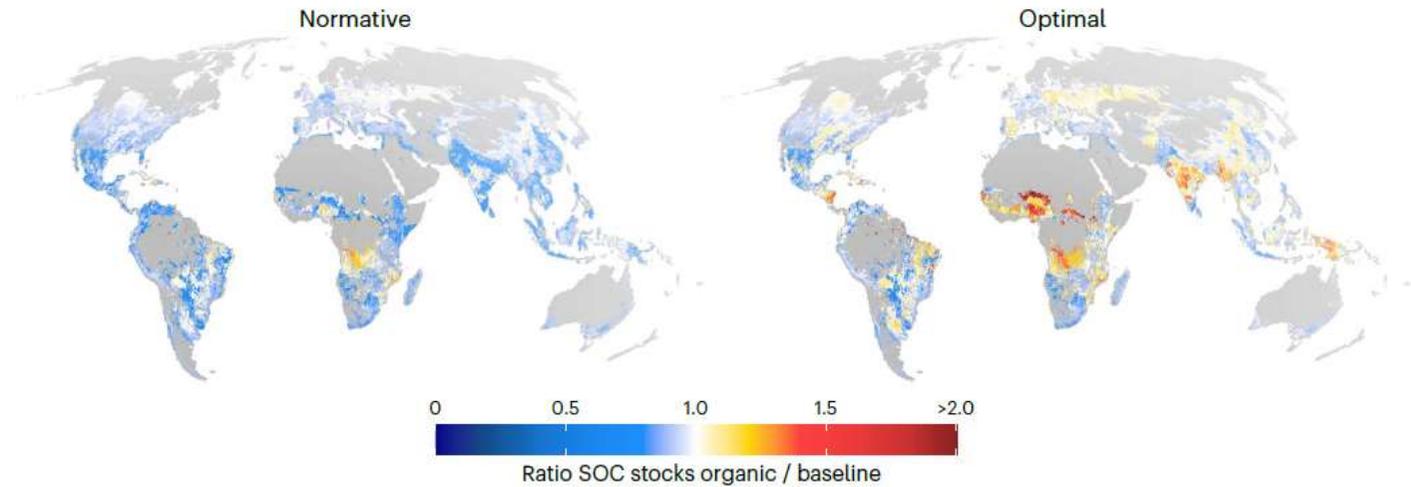

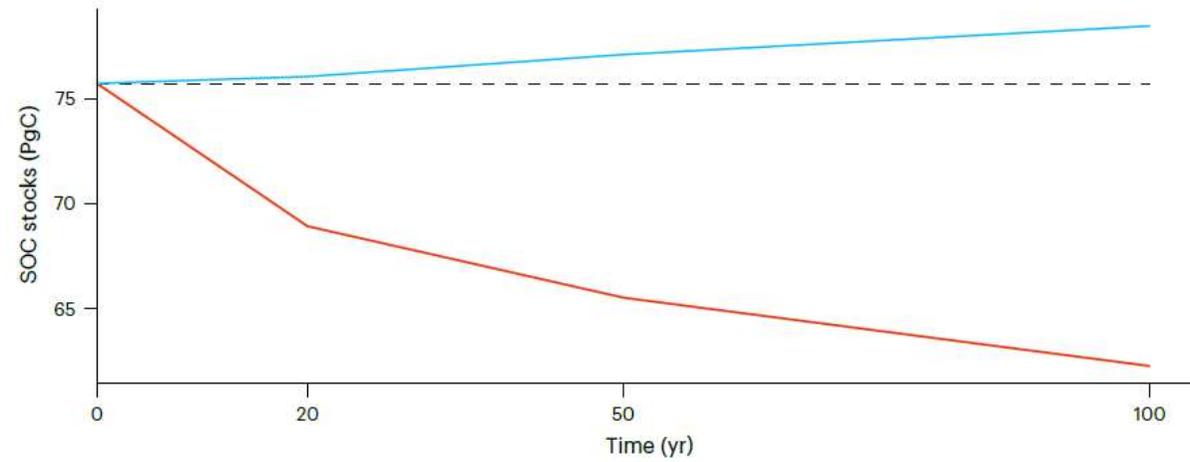

Fig. 2 | Global changes in SOC stocks and SOC stock ratios between the 100% organic scenarios and the baseline at 20 yr. Changes in global SOC stocks (Pg C) in croplands (top) and spatial distribution of ratios (bottom) are reported

for the normative (red line) and optimal (blue line) 100% organic scenarios. The black dashed line represents the baseline's global SOC stocks for croplands.

Agriculture today places great strains on biodiversity, soils, water, atmosphere, and these strains will be exacerbated if current trends in population growth, meat and energy consumption, and food waste continue. Thus, farming systems that are both highly productive and mentally harmless are critically needed. How organic agriculture can meet world food production has been subject to vigorous debate for a decade. Here, we revisit this topic comparing organic and conventional yields with a new meta-dataset three times larger than previous studies containing more than 1000 observations) using an analytical framework that can better account for the variability in the data. We find organic yields are only

A global meta-analysis of yield stability in organic and conservation agriculture

Samuel Knapp^{1,2} & Marcel G.A. van der Heijden^{1,3}

One of the primary challenges of our time is to enhance global food production and security. Most assessments in agricultural systems focus on plant yield. Yet, these analyses neglect temporal yield stability, or the variability and reliability of production across years. Here we perform a meta-analysis to assess temporal yield stability of three major cropping systems:

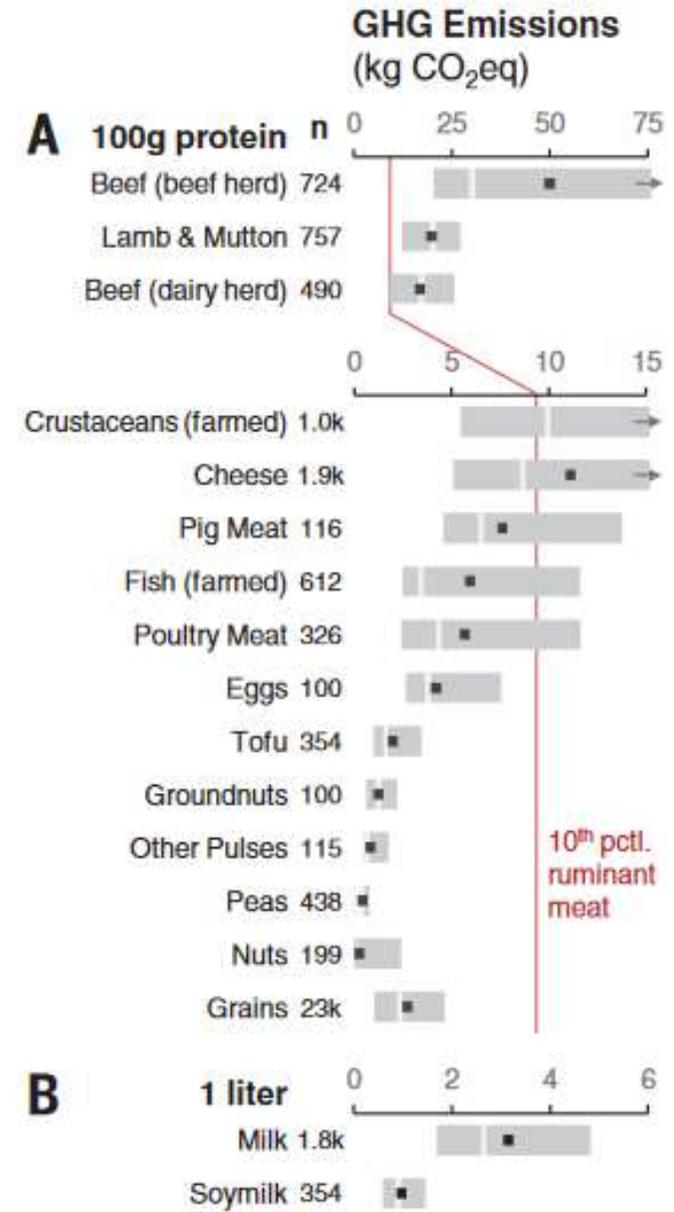

«Es geht darum,
eine Vision für die Tierhaltung in einer

klimafreundlichen,

gleichzeitig aber auch
multifunktionalen

Land- und Ernährungswirtschaft zu formulieren.»

Fokus auf Effizienzmasse, fehlende Systemsichtweise

Beispiel klimaneutraler Biolandbau 2040

Einsparpotenziale der Handlungsebenen
Annahmen gemäss aktuellem Wissensstand

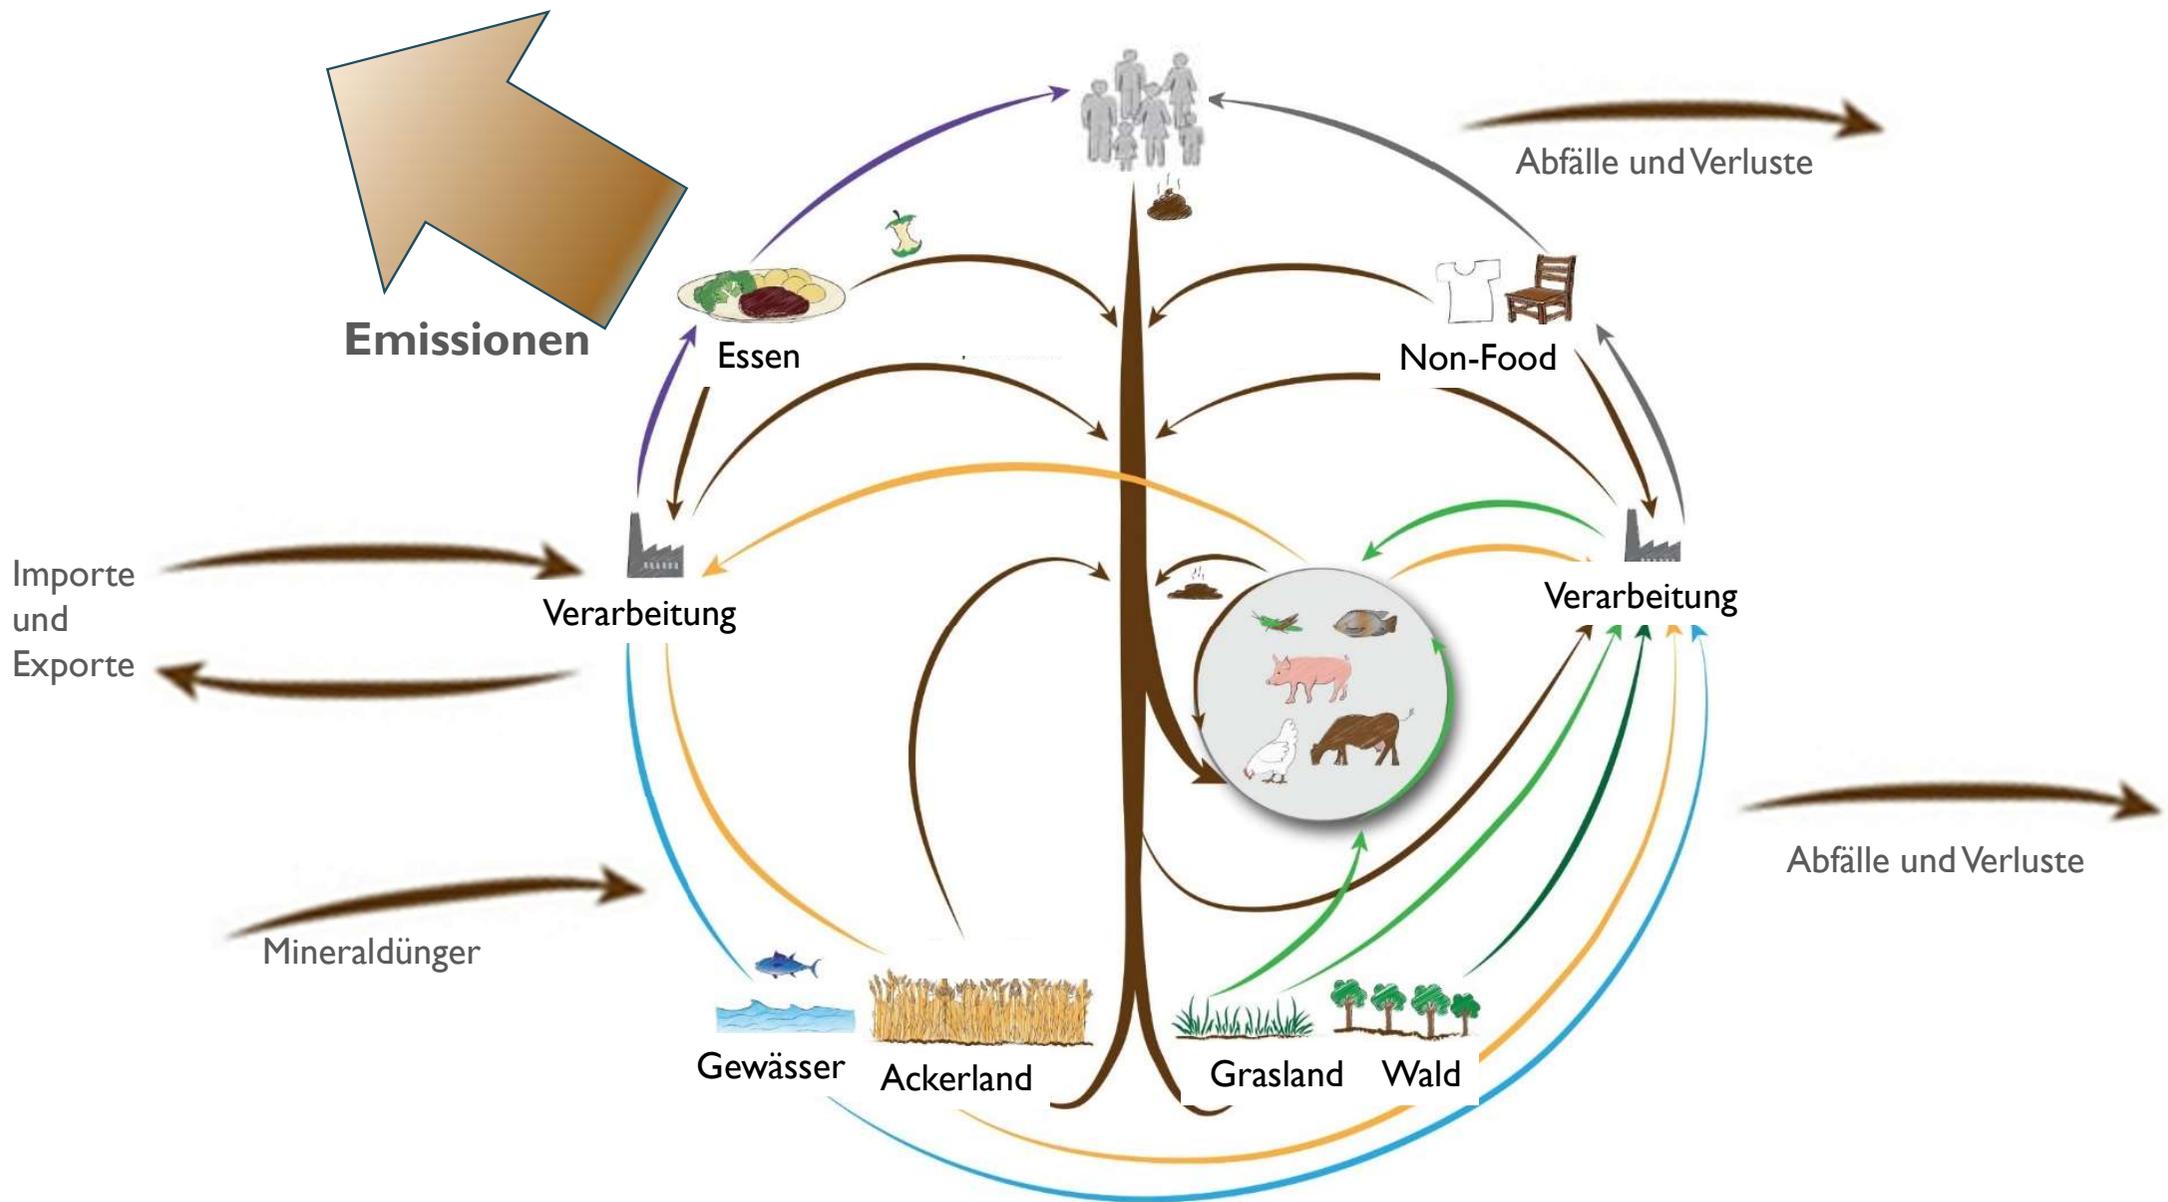

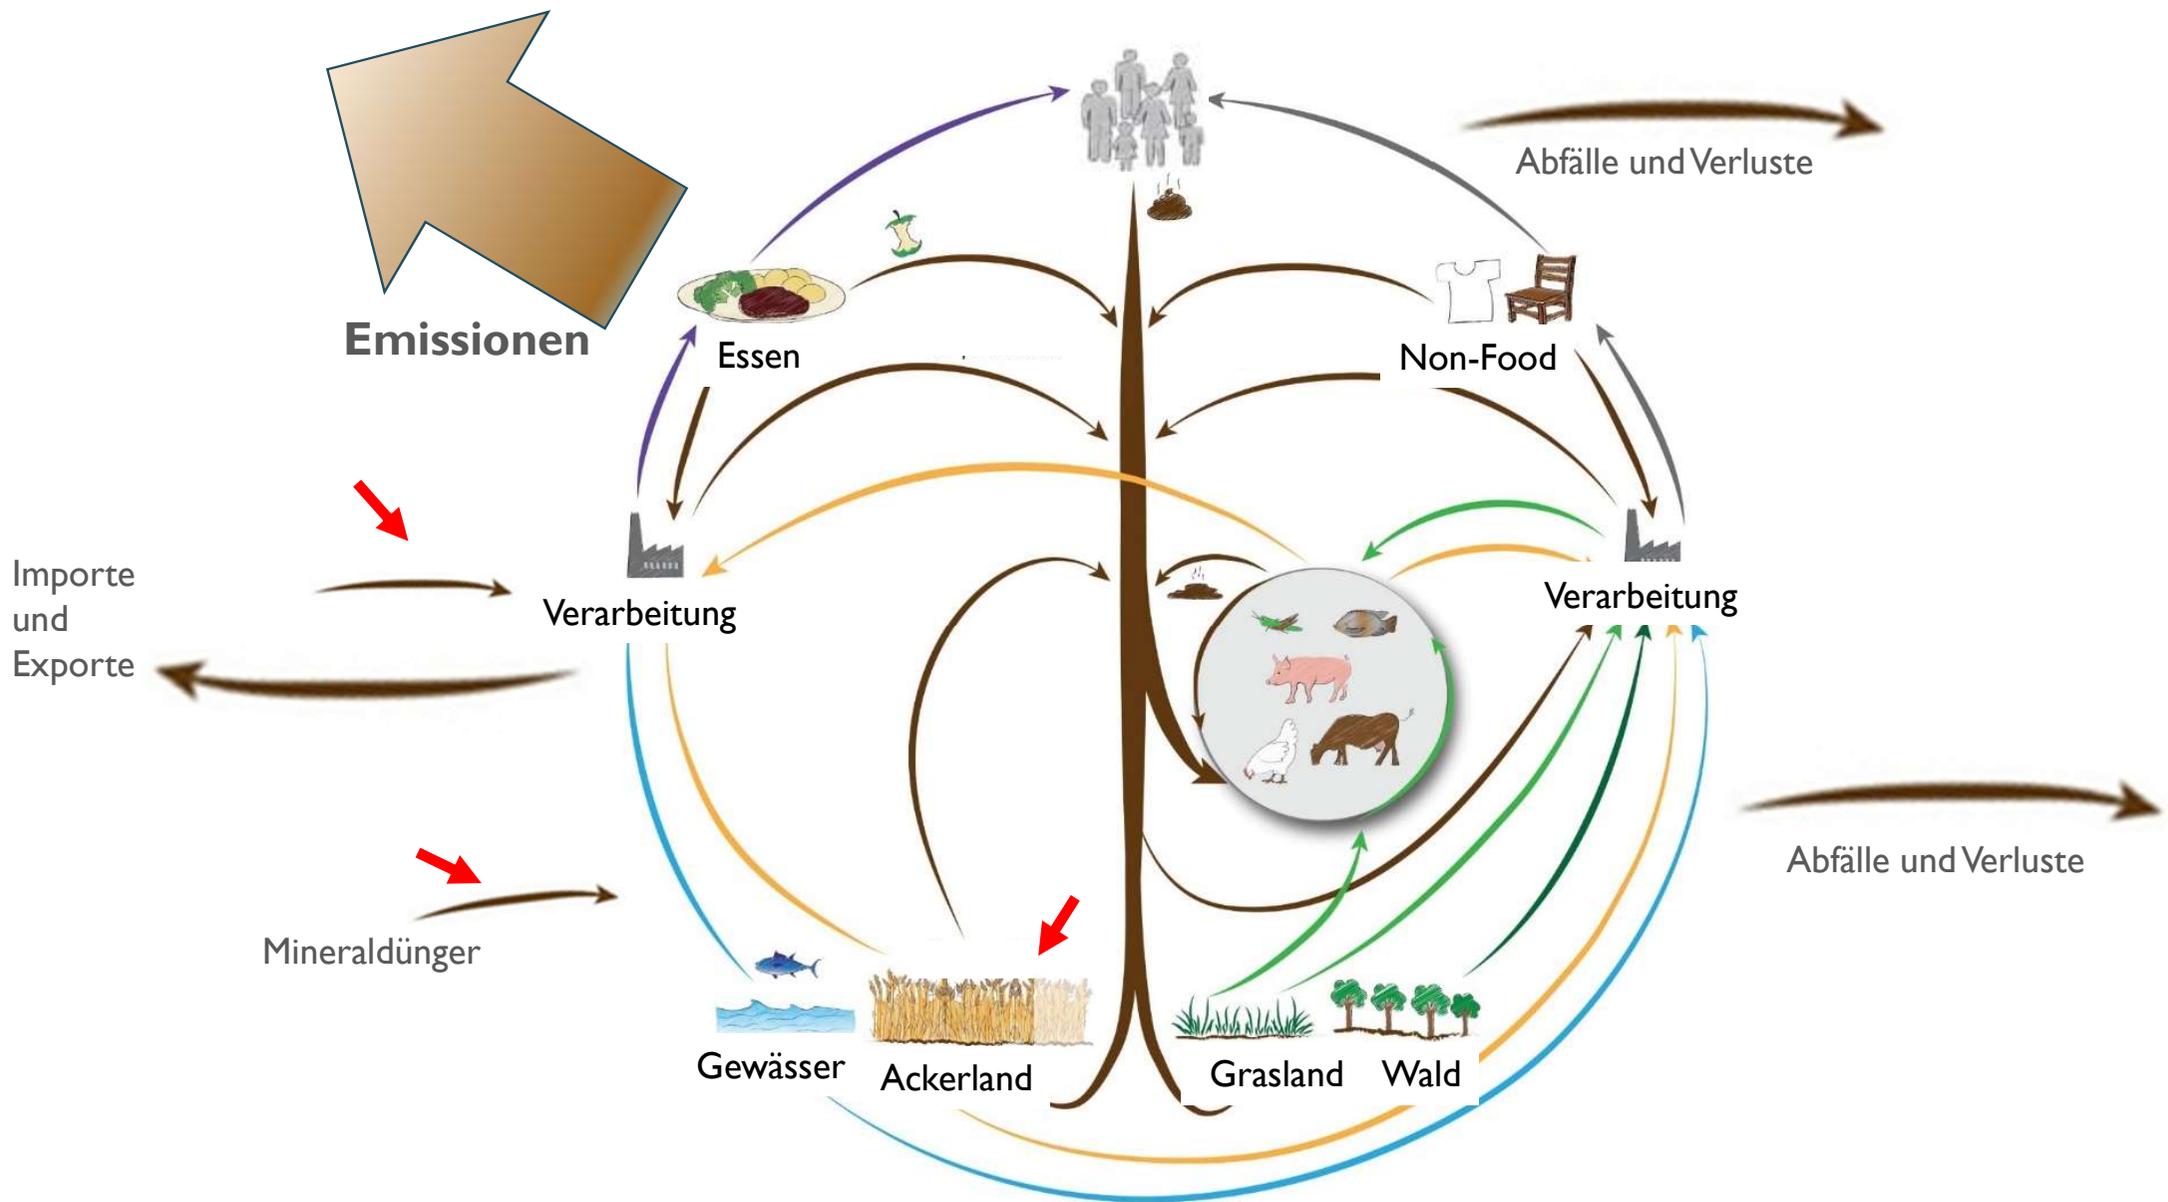

1,5 Mio t CO₂
THG-Emissionen Biolandbau 2040 ohne Massnahmen

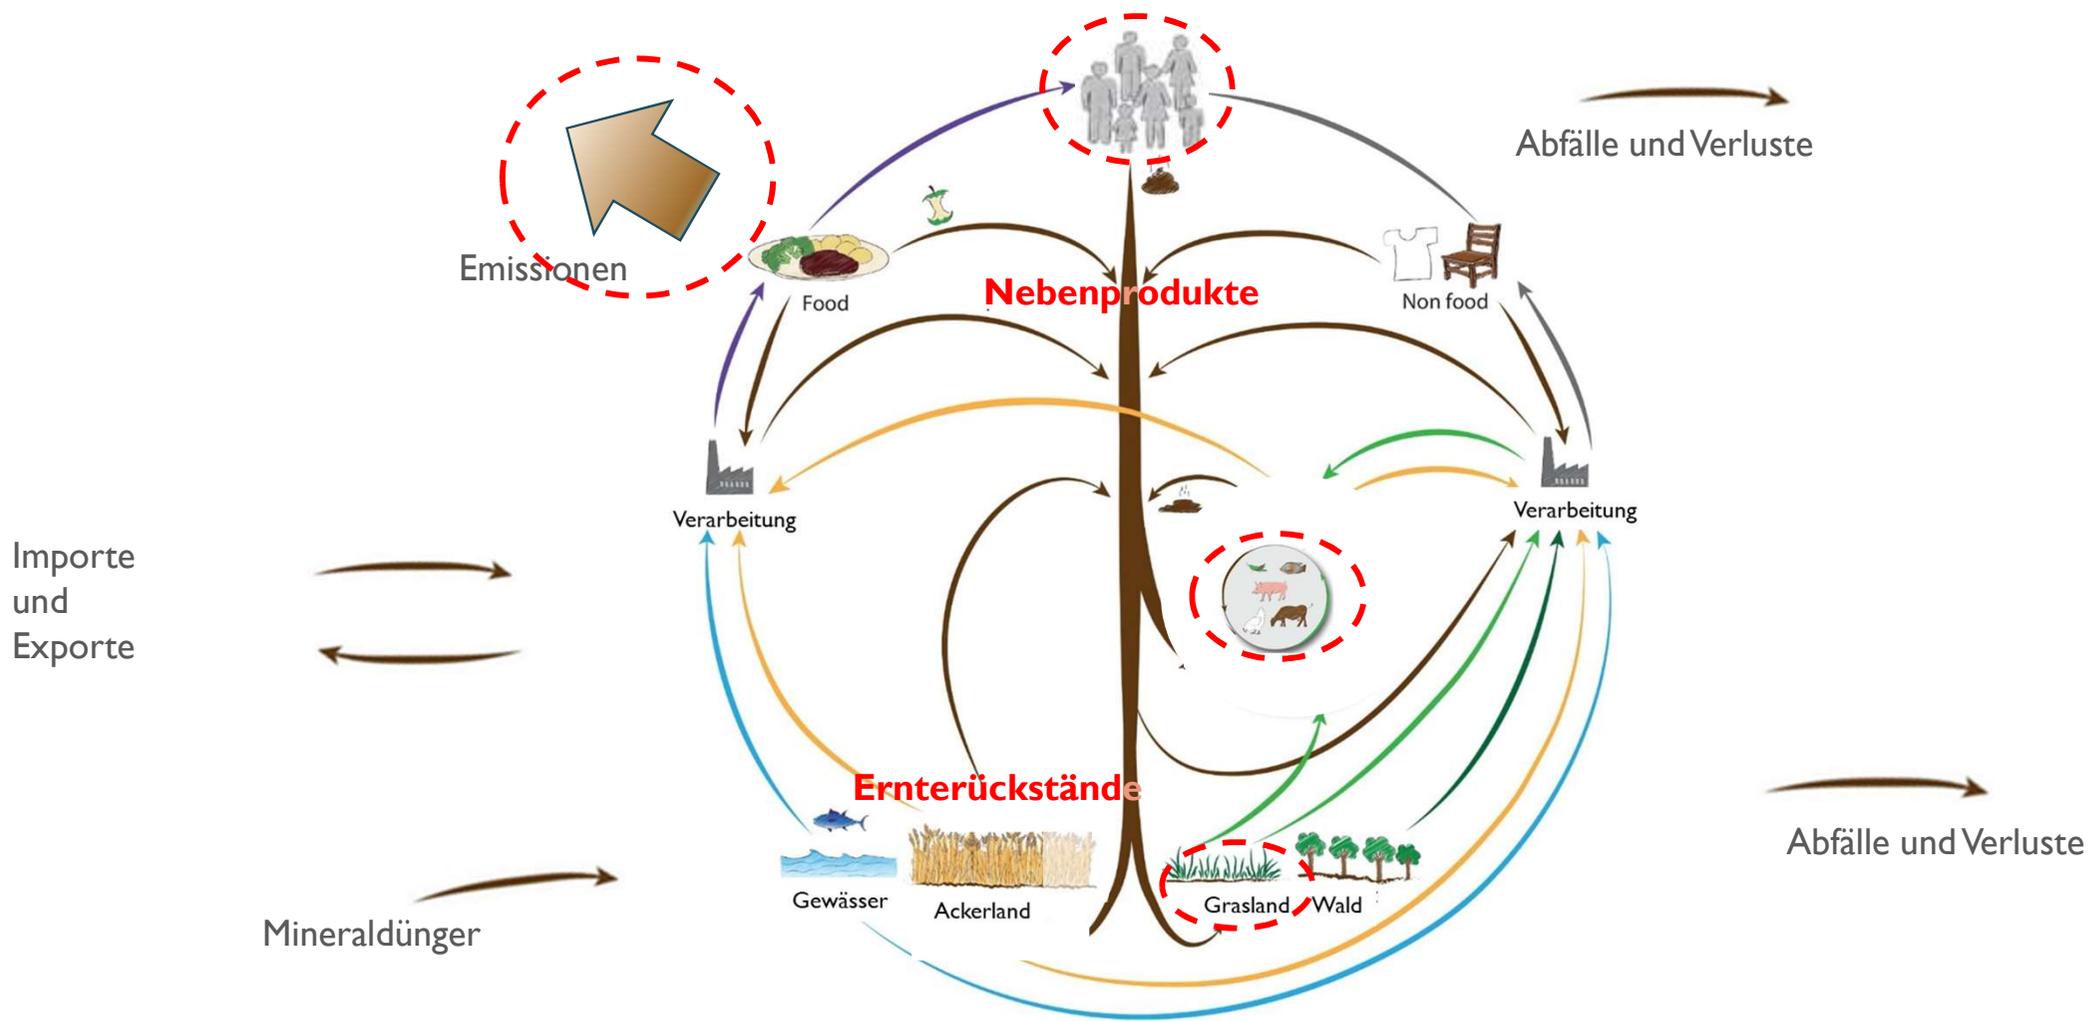

Konsumverhalten bei Ernährung gemäss Ernährungspyramide, entspricht den Zielen, die im Kontext der Klimastrategie Ernährung und Landwirtschaft des BLW diskutiert werden.

Wir MÜSSEN produzieren,

THE ILLUSION OF CHOICE

Why someone already decided
what you will eat for lunch

**PUT CHANGE
ON THE MENU**

Schlussfolgerungen

- Eine **multifunktionale Land- und Ernährungswirtschaft** ist wichtiger als – und umfasst – eine klimafreundliche Land- und Ernährungswirtschaft
- **Nahrungsmittelkonkurrenz ist unvermeidlich** – aber in kleineren zirkulären agrarökologischen Ernährungssystemen mit wirklich gut aufgesetzter Produktion (Fruchtfolgen, etc.) kein zentrales Problem
 - In diesem Kontext ist sie dann Grundlage für eine nachhaltige systemisch konsistente Tierhaltung und nicht verbunden mit übermässiger hochintensiver Tierproduktion
- **Wir müssen Ernährungsumgebungen aktiver gestalten**
 - Dies ist insbesondere eine Chance bei all denen, die sich nicht für nachhaltige Ernährung interessieren

Schlussfolgerungen

- **Verbände, etc.:** rennt nicht den **Unternehmen** hinterher, sondern **setzt die Agenda** selbst!
- **Produktion:** wirklich gute **Biosysteme/Agrarökologie** sind nötig
 - Arbeitet **gegen die Konventionalisierung** (v.a. im Hinblick auf die EU-Ziele)
 - **Wichtige Hebel:**
 - **Stickstoffreduktion** (Mineraldünger, Futtermittelimporte),
 - **Steigerung der systemischen N-Effizienz** (Tierhaltung, Futter vom Acker, Abfall)
- **Wir müssen ernsthaft über die zukünftigen Businesspläne der Unternehmen diskutieren**
 - **Kein Greenwashing, sondern wirklicher Wandel**
