

# Nordic Pioneers of Biodynamic and Organic Agriculture

John Paull<sup>1,\*</sup> and Tord Tuttüren<sup>2</sup>

## ABSTRACT

Fifty Nordic pioneers of biodynamic (BD) agriculture, and hence of organic agriculture, are identified. These individuals, from Norway (n = 23), Sweden (n = 12), Denmark (n = 10), and Finland (n = 5), joined the Experimental Circle of Anthroposophical Farmers and Gardeners in the years 1924–1946. These pioneers comprised both men (n = 35) and women (n = 14), with one member of undetermined gender. The Experimental Circle was headquartered at the Goetheanum, Dornach, Switzerland. One of these pioneers (Anna Wager-Gunnarson) attended the foundational course of biodynamic and organic agriculture, presented by Dr Rudolf Steiner (1861–1925), in eight lectures at Koberwitz (now Kobierzyce, Poland) in June 1924. The core element of the course was that agriculture was properly a biological rather than a chemical pursuit. The ‘Agriculture Course’ was subsequently issued (in German from 1926) as a subscriber-only published book to members (of the Anthroposophical Society) who joined the Experimental Circle. Each Circle member signed a non-disclosure agreement (NDA) and committed to testing the ideas of the course. A milestone was the 1938 book by Ehrenfried Pfeiffer, ‘Bio-Dynamic Farming and Gardening,’ which arguably released Experimental Circle members from their NDA. Nordic members joined progressively over the two decades following the Koberwitz course, with new memberships peaking in 1932 (n = 7), and continuing through the years of World War II (WWII). Biodynamic agriculture is still practiced in the Nordic countries of these pioneers, with Denmark presently accounting for 2,998 hectares, Sweden 873 ha, Norway 548 ha, and Finland 384 ha. The Nordic countries have developed strong organic sectors, with Sweden accounting for 610,543 ha of certified organic agriculture (which is 20.2% of its agricultural land), Finland 315,112 ha (14.4%), Denmark 299,998 (11.4%), and Norway 45,181 ha (4.6%). Iceland has no identified BD pioneers, presently no BD hectares, and 6,440 ha of organic agriculture (0.4% of total agriculture land). The identification of the 50 Nordic pioneers of the present paper provides recognition as early-adopters and invites further research on their life, legacy, and role in founding BD and organic agriculture in the region.

## 1. INTRODUCTION

The precursor of ‘organic farming’ was ‘biodynamic farming’, and the precursor of ‘biodynamic farming’ was ‘Anthroposophical farming’. The push for a differentiated agriculture occurred following World War I (WWI). Fuelled by European advances in chemistry, WWI witnessed mass slaughter in Europe on an industrial scale (Freemantle, 2015). The German Haber-Bosch process of ‘fixing’ nitrogen from the air (Haber, 2002) enabled the industrial-scale manufacture of explosives on an unprecedented scale. The further innovation of poison gas warfare, pioneered by Germany in WWI, combined with the new and ready availability of cheap explosives, set the stage for the most dastardly killing fields of history-up to that time.

In the wake of the WWI defeat of Germany, came fresh challenges for agriculture, and opportunities for the chemical industry. The chemistry of war was repurposed as the chemistry of farming. The

Haber-Bosch process was redirected to producing cheap and abundant synthetic fertilisers (Lamer, 1957; Smil, 2001). The weapons of chemical warfare were rebadged for a new ‘war on pests.’ There were fortunes to be made in this grand new commercial enterprise, and oversight by environmental protection agencies (EPAs) was more than half a century into the future (Lytle, 2007; Paull, 2013b).

The years between the two World Wars witnessed the banning of some (not all) chemical warfare (Charles, 2005; Neilands, 1971) and the beginning of the pushback against ‘chemical farming’. In the summer of 1924, the New Age philosopher Dr Rudolf Steiner (1861–1925) presented his Agriculture Course at the estate of Count Carl Keyserlingk (1869–1928) at Koberwitz (near Breslau, Germany, at the time; now Kobierzyce near Wrocław, Poland, since 1945) (Paull, 2011a; Steiner, 1924a, 1924b). Steiner proposed agriculture with a focus on biology rather than chemistry, and proposed treating the farm as an ‘organism’ rather than as a factory (Steiner, 1926).

At his eight-day Koberwitz course, Steiner founded the Experimental Circle of Anthroposophical Farmers and Gardeners (Steiner, 1929). The Experimental Circle was tasked with putting his agricultural ideas for a differentiated agriculture to the test, establishing what worked, and publishing the results. In the decades that followed, the membership of the Experimental Circle grew to span the world (Paull, 2011b).

From the outset, there were Nordic Anthroposophists present in the Biodynamics enterprise. At Koberwitz were Paula Bauer (of Kalv, Sweden) and Anna Gunnarsson (of Stockholm, Sweden) (Paull, 2020a). About half of the Koberwitzers joined the Experimental Circle at the course. From 1926 onwards, Circle members were issued with a personalised copy of the ‘Agriculture Course’ in German from the Goetheanum (Anthroposophy headquarters, Dornach, Switzerland) (Steiner, 1926).

Although the English translation of the Course was available shortly after the German printed edition, other translations were slow to follow (Steiner, 1929). Translations into Nordic languages took decades: a translation of the ‘Agriculture Course’ in Swedish appeared in 1966; Danish in 1976; Norwegian in 1992; while Finnish and Icelandic translations are yet to appear (perhaps projects for the Koberwitz Centenary in 2024?) (Paull, 2020b).

The Nordic countries comprise Denmark, Finland, Norway, Sweden, and (from 17 June 1944) Iceland. The present paper identifies those Nordics who joined the Experimental Circle, viz., the Nordic pioneers of Biodynamic farming (and thereby organic farming).

## 2. METHODS

Records held in the Goetheanum Library and Archives are the data source of the Nordic pioneers of Biodynamics (Course Register, 1926+). Anthroposophists who joined the Experimental Circle of Anthroposophical Farmers and Gardeners each signed a non-disclosure agreement (NDA) stating their name, where they proposed to carry out their experiments, and an undertaking not to disclose the practices. They each received a copy of the ‘Agriculture Course’ (in German), numbered and inscribed with their name. They undertook to return their copy of the ‘Agriculture Course’ should they cease to be a member of the Anthroposophical Society (or when they died).

The original records of the Experimental Circle are ‘mostly’ complete (however, the records from #89 to #149 and from #411 to #500 were not sighted and appear to be missing). In the archival record, data were entered, one line per member, as a running record, by many different hands over the years. Some entries are handwritten, and some entries are typed. Some data are missing in the record, some numbers are missing, and some numbers were issued several times (e.g., a book that was returned could be reissued to a new recipient with the original number retained). For the present paper, those Experimental Circle members with Nordic addresses or affiliations were extracted.

Names and addresses were recorded somewhat inconsistently in the archival record, with some names in full, some names with initials, some addresses recorded as a postal address, and others more generically (e.g., as a city but no street), and some not at all, e.g., Wårnjhelm, #87 (Lõfstrõm, 2008). The various scribes, writing styles, and legibilities mean that some guesswork was involved in transcribing the writing; the objective has been to present place names as they appear in the archival records (keeping in mind that place-name spellings have varied over time and have also varied according to the language of the scribe). Due to the nature of the written records, it appears likely (to the authors) that the spelling of some names and places may be subject to revision as further and better particulars are available. The default position of the authors has been to report (in Table I) the record of each Nordic Experimental Circle member as it appears in the archival record, and, generally, spelling variants are retained as per the archival record (e.g., both Olav and Olaf Funderud, <blank> and #543). Diacritical marks appear somewhat inconsistently in the archival record, and some inconsistencies may remain in Table I. The ‘Country’ column adopts the English spelling. The Gender column records the best inference of the authors; in the records, most entries lack a gendered title, while some records do include a gendered

title, e.g., ‘Frau’ (= Mrs = F), ‘Frl’ (= Fräulein = Miss = F), and ‘Herr’ (= Mr = M). Entries with titles have the titles retained in [Table I](#) (e.g., Baron & Graf).

Herr Alf. H[off] Kvaernø	Trondhjem, Norwegen	21.12.1946	796	M	Norway

Note: \*attended the Koberwitz course; \*\*# reissued; \*\*\*crossed through; <bl> = blank; text in square brackets are author comments.

Notes in the address field of the archival record are retained in Table I. Such notes include: ‘in’ = in (e.g., #586); ‘bei’ = near (e.g., #702); ‘Ohne Verpflichtungserklärung’ = ‘without declaration of commitment’ (e.g., #727, #729, #734). For #597, the authors take ‘Gl.’ to be an abbreviation of ‘Gamle’ (= old; hence ‘Gut Gamle’ = old estate).

The record for Herr Albin Leonhardtson, Stockholm, Sweden, #257A, issued 3 July 1929, appears in Table I as per the archival record. The suffix ‘A’ appears on nineteen consecutive entry numbers, all on the same page of the archival record. The significance of the suffix is unknown (to the authors). The suffixed numbers do not appear to occur elsewhere in the record sans suffix. The German language edition of the ‘Agriculture Course’ (“Copyright 1929”, red cover) copy #257 (without suffix) has

been located and inspected by the authors. It is inscribed in that book as issued to: “Baron Dr v Veltheim-Ostrau”, and it is stamped with his personal stamp: “Sammlung des Dr Hans-Hasso v. Veltheim-Ostrau”. The record of this copy #257 issue to Veltheim-Ostrau was not located in the archival record. A later owner of #267 has personalised the copy with a signature (“Dr H. Berendt”) on the front right endpaper. This mystery (of the twins #257 and #257A) remains unresolved.

Dr Alfred Usteri (1869–1948) was a candidate for inclusion in [Table I](#) but was not included. His address appears in the archival record for copy #384 of the ‘Agriculture Course’ as “Reinach (Gratis) Norwegen” ([Course Register, 1926+](#)). His address appears for an earlier issue, #22, as “Reinach bei Basel” ([Course Register, 1926+](#)). He attended the Koberwitz course with the address then recorded as Reinach, Switzerland ([Paull, 2020a](#)). Reinach is in Switzerland: “In 1920, he finally settled near the Goetheanum, in the then idyllic village of Reinach. He lived there until the end of his life” ([Bracker, 2003](#), p. 1). It appears that Usteri had no association with Norway and that the archival record associating Usteri and Reinach with Norway is likely a typographical error.

Previous geographic listings of Experimental Circle members have reported those joining the Experimental Circle between the wars (e.g., [Paull, 2013a, 2018, 2019a, 2019b](#)). The book ‘Bio-Dynamic Farming and Gardening’ by Ehrenfried Pfeiffer (1899–1961) appeared in 1938 and arguably released Circle members from the NDA (and so the ‘secret’ nature of the Experimental Circle was thereby extinguished) ([Paull, 2011c; Pfeiffer, 1938a](#)). There were no new Anglo members of the Experimental Circle during WWII, so Anglo lists have a ‘natural’ pre-WWII cut-off. However, as shown in [Table I](#), there were new Nordic members joining after 1938 and during WWII. The present listing accounts for Nordic Experimental Circle members up to the end of 1946. The list of [Table I](#) is subject to future revision as further and better particulars materialise.

### 3. RESULTS

Fifty individual Nordic members joined the Experimental Circle of Anthroposophical Farmers and Gardeners up to the end of 1946 ([Table I](#)). There were both men ( $n = 35$ ) and women ( $n = 14$ ) (with one member of undetermined gender, viz. B. Wolontis, #727) ([Table II](#)).

TABLE II: DISTRIBUTION OF THE NORDIC MEMBERS OF THE EXPERIMENTAL CIRCLE OF ANTHROPOSOPIHICAL FARMERS AND GARDENERS BY GENDER (N = 50)

Gender	Frequency	Percentage
Male	35	70%
Female	14	28%
Not known	1	2%

Experimental Circle members ( $n = 50$ ) came from Norway ( $n = 23$ ), Sweden ( $n = 12$ ), Denmark ( $n = 10$ ), and Finland ( $n = 5$ ); there were no members from Iceland ([Table III](#)). The timeline of members joining reveals the peak joining year was 1932. For some years, new memberships were zero. New members continued to join during World War 2 (WW2); the war slowed the uptake of memberships but did not extinguish it ([Fig. 1](#)).

TABLE III: DISTRIBUTION OF THE NORDIC MEMBERS OF THE EXPERIMENTAL CIRCLE OF ANTHROPOSOPIHICAL FARMERS AND GARDENERS BY THEIR COUNTRY OF AFFILIATION (N = 50)

Country	Frequency	Percentage
Norway	23	46%
Sweden	12	24%
Denmark	10	20%
Finland	5	10%
Iceland	0	0%

There are 51 line entries in [Table I](#); one member appears twice (Funderud, as <blank> in 1931 and #543 in 1932). A single recipient receiving multiple copies of the ‘Agriculture Course’ is not unknown (see [Paull, 2019a](#)). Anna Gunnarsson (#235) is the only Koberwitzer who appears in [Table I](#). Entry #533 is crossed through in the archival record; the number does not appear to have been issued to another.

For several early Circle members, the dates presented in [Table I](#) are attributed (and hence appear in square brackets). The Agriculture Course #643 appears twice, first issued in October 1936 and to a different

Fig. 1. Annual distribution of the 'Agriculture Course' to Nordic members of the Experimental Circle of Anthroposophical Farmers and Gardeners (n = 51, one member is accounted for twice).

recipient in September 1938. It was a known practice to reassign returned copies of the 'Agriculture Course' to new members.

Karl Döbelin, as #277, appears with a German address in 1929; he migrated to Norway the following year and is included in [Table I](#) on that basis, and accounted for in [Table III](#) as Country = Norway ([Tutturen, 2022](#)). Two recipients appeared in 1931, lacking an assigned number and stating they were supplied via Karl Döbelin (see [Table I](#)).

#### 4. DISCUSSION AND CONCLUDING REMARKS

The 50 Nordic Biodynamics pioneers offer many starting points for further research ([Table I](#)). It appears that most pioneers were ethnic Nordics, and some were German immigrants. One Koberwitzer appears in [Table I](#) (Anna Wager-Gunnarsson as #235) ([Paull, 2020a](#)).

Karl Döbelin (1898–1976) appears in [Table I](#) as the recipient of #277 and also as the conduit for four Agriculture Courses for new Experimental Circle members (#587, #596, plus two that lack numbers, viz. Funderud and Busch). In 1950, Karl Döbelin became the inaugural chair of the Norwegian Biodynamic Association (Biologisk-dynamisk Forening i Norge; [Tutturen, 2022](#)). The story of the couple, Karl Döbelin and his wife, Waldtraut Stockmeyer (1888–1951), two Biodynamic German immigrants to Norway, has been related elsewhere (the Norwegian rendering of 'Döbelin' is 'Døbelin') ([Tutturen, 2022](#)). Waldtraut Stockmeyer appears in the list of Koberwitzers but not in [Table I](#) ([Paull, 2020a](#)). It was Stockmeyer who introduced Döbelin to Biodynamics ([Tutturen, 2022](#)).

Carl Vett (1871–1956) was the first Nordic member of the Experimental Circle ([Fig. 2](#)). Vett was a keen advocate for Biodynamics ([Nilo, 2003](#)). He published an early account of Biodynamics ([Vett, 1936](#)). He facilitated research by Karsten Iversen of the Danish State Institute for Plant Culture (with the cooperation of Ehrenfried Pfeiffer at the Goetheanum) to test the efficacy of the BD preparations (no significant differences reported) ([Iversen, 1936](#)).

Both of these accounts ([Iversen, 1936](#); [Vett, 1936](#)) were published outside of the auspices of the Experimental Circle and of the Anthroposophic press. They reveal Carl Vett as a maverick (and perhaps impatient) advocate of Biodynamics. These two accounts appeared (in Danish) despite the dual constraints of, firstly, Rudolf Steiner's personal injunction to keep BD practices secret until they were proven by the Experimental Circle and then published, and secondly, the terms of the NDA for members of the Experimental Circle. Despite this, they appeared two years before Ehrenfried Pfeiffer's book 'Bio-Dynamic Farming and Gardening' ([Pfeiffer, 1938a, 1938b](#)).

Vett's motivation for going public with Biodynamics in Denmark in 1936 may have been his foreboding of the developments in Nazi Germany that Anthroposophy and all books by Rudolf Steiner were banned in 1935 ([Paull, 2023](#)).

Vett wrote: "In a time of social unrest, characterised by the rise of National Socialism [nazistisk-socialistisk], it is a sad fact that new ideas, which go against the mainstream, struggle to make themselves known, or even considered for an impartial investigation. The rising influence of the suppressions by the socialising process makes it impossible for free (open minded) initiatives, which previously allowed ordinary people to support new ideas, which have not yet achieved the official scientific seal of approval" ([Vett, 1936](#), p. 27).

Fig. 2. Carl and Ingeborg Vett (cropped image) (Source: Magasin du Nord Museum, København; nd).

A British biodynamic farmer, Lord Northbourne (1896–1982), took Rudolf Steiner’s characterisation of ‘the farm as an organism’ and coined the term ‘organic farming’ (in 1940) and juxtaposed it with ‘chemical farming’ (Northbourne, 1940; Paull, 2014). It is organic farming, this child of biodynamics, that has successfully colonised global agriculture (albeit at a modest level; 1.6% of global agriculture is certified organic) (Willer *et al.*, 2023).

The Nordic countries have developed strong organics sectors. Together, they report 1,277,274 hectares of certified organic agriculture. Sweden reports 610,543 hectares of certified organic agriculture, and this accounts for 20.2% of the country’s agricultural land. Finland reports 315,112 ha of organics, accounting for 14.4% of agriculture. Denmark reports 299,998 ha of organics, accounting for 11.4% of agriculture. Norway reports 45,181 ha, accounting for 4.6% of agriculture. Iceland reports 6,440 ha of organic agriculture, accounting for 0.4% of agriculture. Globally, 1.6% of agriculture is certified organic (76.4 million ha), so the Nordic countries (except Iceland) are out-performing the world average (Willer *et al.*, 2023).

Biodynamic farming is still practised in the Nordic BD pioneering countries. The total of Nordic Biodynamic hectares is 4,803, accounting for 0.38% of the Nordic organic agriculture hectares. Denmark reports 2,998 ha of Biodynamic agriculture, accounting for 1.0% of its certified organics sector. Sweden reports 873 ha of BD, accounting for 0.14% of its organics sector. Norway reports 548 ha of BD, accounting for 1.2% of its organics sector. Finland reports 384 ha of BD, accounting for 0.85% of its organics sector. Iceland reports no BD hectares (Paull & Hennig, 2020).

Naming the Nordic pioneers of biodynamics and associating places and dates to their enterprises provides some recognition of these early adopters of biodynamic and organic agriculture and offers multiple loci for further research on their lives and legacies. As noted in the Methods section, there are some gaps in the records, so (as always) absence of evidence is not evidence of absence.
