Chicory root improves the taste and odour of organic pork

Few days of feeding with chicory root reduces the boar taint in slaughterpigs and improves the eating quality. At the same time feeding with chicory root changes the intestinal environment and leads to a decreased incidence of swine dysentery and intestinal parasites. The new results may allow the production of entire male pigs without boar taint.

Joint European Organic Congress

In May 2006, researchers from at least ten EU-funded research projects in organic food and farming join the same [congress](#) and present their results for organic producers and processors. Open to all participants.

Revision of organic rules and principles

IFOAM's principles of organic farming is now being revised. Further, the EU-project [Organic Revision](#) draw up recommendations for development of EU's regulation in organic agriculture. [Follow the work](#) on EcoWiki.

Outdoor production of slaughterpigs

Rearing of slaughterpigs on pastures cause a potential for high environmental N loss. Yet, the risk can be mitigated by adequate choice of production season, restricted feeding and paddock management. [More..](#)
