The mother-young bond and the process of weaning in farm animals - Consequences for behavioural development and welfare of the offspring

Trial lecture Juni Rosann E. Johanssen 09.02.24, NMBU

## Agenda

- Animal welfare
- Definitions
- Focus cattle, sheep, pigs
- Bonding
- Hider or follower
- Natural suckling and weaning
- Weaning practice
- Separation and weaning challenges and actions
- Offspring behavior and welfare
- Human-animal interactions
- Finals thoughts and considerations

### Animal welfare – Five domains

### Definitions

- Mammal: Warm-blooded, fur/hair, milk<sup>1</sup>
- Ungulate: One, two or three toes<sup>2</sup>
- Articial: Born less developed<sup>2</sup>
- Precocial: Born more developed<sup>2</sup>
- Bonding: Establishment of relationship
- Weaning: Accustom to solid feed

Ref: Frafjord 2021<sup>1</sup>. Keeling et al. 2001<sup>2</sup>.

## Cattle, sheep and pigs

**Gestation – Number of offsprings – Number of teats** 

- Cattle: 9 months, 1 calf, 4 teats
- Sheep: 5 months, 2 lambs, 2 teats
- Pigs: 3.7 months 16 piglets, 14-16 teats

#### - Det var helt vanvittig å se på, det tok jo aldri slutt

Søya fra Snertingdal stoppet ikke før hun hadde født hele åtte lam. Eksperter har aldri hørt på maken.

Stein S Eide

SVÆRT SJELDEN: Den seks år gamle søya fra Snertingdal fikk hele åtte lam på en gang. FOTO: PRIVAT

#### Fyttigrisen for en fødsel

HAMAR (NRK): Det er stappfullt i bingen til purka Gode Gloria. Tirsdag fødte hun hele 26 unger, nesten dobbelt så mange som et gjennomsnittlig grisekull.

Line Fosser Vogt

Publisert 9. mai 2019 kl. 14:03 Oppdatert 9. mai 2019 kl. 15:53

() Artikkelen er flere år gammel.

GRISEFLAKS: Gode Gloria slapper av i bingen etter å ha født 26 grisunger. Purka har vært heldig som fikk så mange unger, forteller ekspertene.

## Bonding

3

## Mother-young bonding

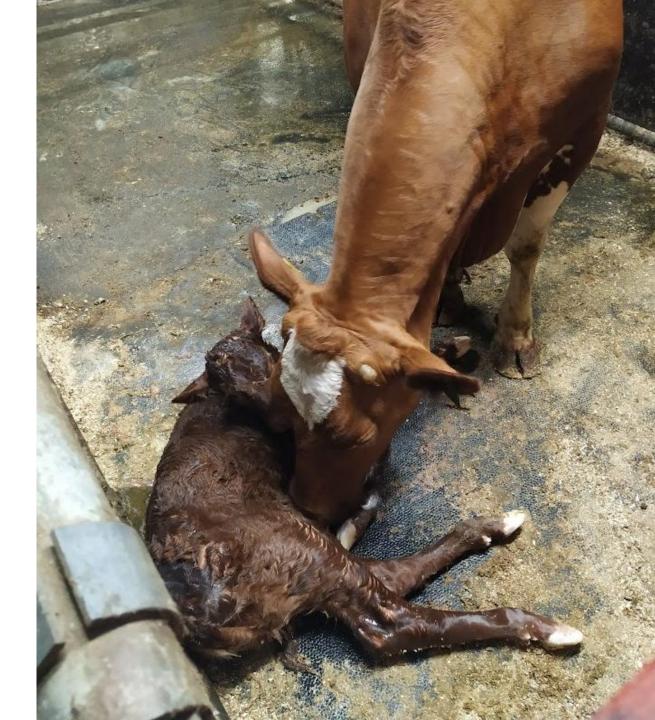

- Significant for offspring survival <sup>1</sup>
- Suitable birth place<sup>2</sup>
- Signals and stimuli for bonding:
  - Smell, vocalizations, tactile <sup>34</sup>
- Meet the offspring's needs (e.g. nourishment and protection) <sup>5</sup>
- Bonding characteristics (e.g. allogrooming, proximity) <sup>5</sup>
- Recognition learning <sup>6</sup>, behavioral and social learning <sup>7</sup>
- Variety in maternal behavior (e.g. stress <sup>8</sup>, genes<sup>9</sup>, feed access <sup>10</sup>)

Ref: Nowak et al. 2000<sup>1</sup>, Rørvang et al. 2018<sup>2</sup>, Fleming et al. 1999<sup>3</sup>, Okabe et al. 2012<sup>4</sup>, Newberry & Swanson 2008<sup>5</sup>, Bienboire-Frosini et al. 2023<sup>6</sup>, Orihuela & Galina 2021<sup>7</sup>, Dwyer 2013<sup>8</sup>, Nevard et al. 2022<sup>9</sup>, Berger 1979<sup>10</sup>

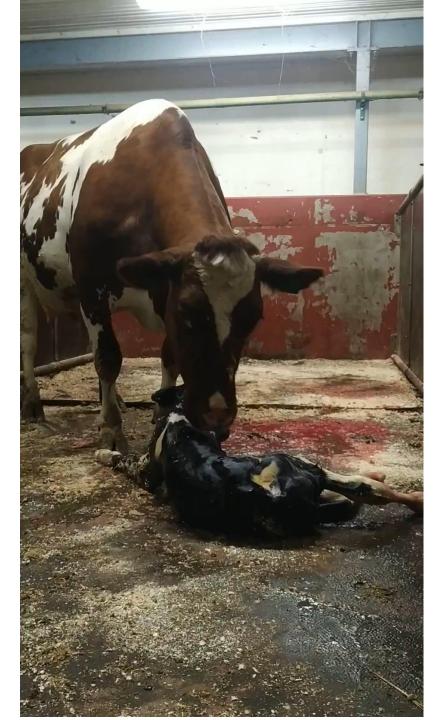

## Cow-calf bonding

- Leave herd before calving:
  - Affected by genes and environment <sup>1</sup>
- Licking of calf Most during first hour <sup>23</sup>
- Calf try standing after 10 min, standing after 46 min, suckling after 97 min <sup>3</sup>
- Variety in maternal behavior
  - One breed more licking and longer suckling than another breed <sup>4</sup>
  - Primiparous cows more abnormal maternal behavior <sup>5</sup>

Ref: Rørvang et al. 2018  $^{\rm 1}$ , Jensen 2012  $^{\rm 2}$ , Lidfors & Jensen 1988  $^{\rm 3}$ , Le Neindre & D'Hour 1989  $^{\rm 4}$ , Barrier et al. 2012  $^{\rm 5}$ 

## Cow-calf bonding

## Ewe-lamb bonding

- Leave herd before lambing <sup>1</sup>:
  - Affected by genes, environment<sup>2</sup>, domestication<sup>3</sup>
- Licking of lamb <sup>4</sup>
- Standing within short time, down to a few minutes <sup>5</sup>
- Suckling within first hour <sup>6</sup>
- Bond through odour <sup>7</sup>, visual and acoustic signals <sup>8</sup>
- Accept own lamb, reject other lambs <sup>8</sup>
- Variety in maternal behavior:
  - Sheep adapted a tougher environment more intense
  - maternal behavior, more protective 89

Ref: Shackleton & Shank 1984 <sup>1</sup>, Squires 1975 <sup>2</sup>, Dwyer & Lawrence 2005 <sup>3</sup>, Dwyer 2013 <sup>4</sup>, Vince 1993 <sup>5</sup>, Nowak et al. 2017 <sup>6</sup>, Nowak et al. 2011 <sup>7</sup>, Mora-Medina et al. 2016 <sup>8</sup>, Svennekjær 2020 <sup>9</sup>.

## Sow-piglets bonding

- Can walk 5-10 km to find nest-place<sup>1</sup>
- 10 h on building nest<sup>1</sup>
- No licking of piglets<sup>1</sup>
- Vocalisations and nose-to-nose-contact<sup>2</sup>
- More communication while active Less mortality<sup>3</sup>
- Protective mothers Less crushing<sup>4</sup>

Ref: Keeling et al. 2001<sup>1</sup>, Portele et al. 2019<sup>2</sup>, Ocepek & Andersen 2018<sup>3</sup>, Anderson et al. 2005<sup>4</sup>.

## Hider or follower?

- Hider Offspring hides the first days<sup>1</sup>
- Follower Offspring follow the mother from first day1
- May vary within species<sup>2</sup>
- Cattle Hiders<sup>1,3</sup>, but some variation depending on environment<sup>4</sup>
- Sheep Followers<sup>1</sup>, but muflon lambs observed to hide for 3 days<sup>5</sup>
- Pigs Hiders, in nest for 1-2 weeks<sup>6</sup>, more outside the nest the last days<sup>7</sup>, may change nest within the 1-2 weeks<sup>8</sup>
- Followers suckling More frequent and short bouts<sup>1</sup>
- Hiders suckling Less frequent and longer bouts<sup>1</sup>

Ref: Lent 1974<sup>1</sup>, Rørvang et al. 2018<sup>2</sup>, Hall 1989<sup>3</sup>, Vitale et al. 1986<sup>4</sup>, Shackleton & Schank 1984<sup>5</sup>, Van Kerchaver 2023<sup>6</sup>, Jensen & Redbo 1987<sup>7</sup>, Keeling et al. 2001<sup>8</sup>

## Suckling and weaning in cattle, sheep and pigs

Natural behavior vs livestock practice

## The natural weaning process

- Parental investment theory Parent-offspring conflict<sup>1</sup>
- Long process → Weaned offspring<sup>2</sup>
- Gradual decrease of maternal care and suckling
- Mother initiates fewer sucklings and ends more
- Offspring increase solid feed intake
- Social independence<sup>3</sup>
- Variations in weaning age<sup>4</sup>
- Social bonds can be lasting

Ref. Trivers 1974<sup>1</sup>, Keeling et al. 2001<sup>2</sup>, Freitas-de-Melo et al. 2022<sup>3</sup>, Schaller 1977<sup>4</sup>.

# Cow-calf natural suckling and weaning

- 4-10 sucklings/day<sup>1</sup>:
  - Decrease with age<sup>2</sup>
- 7-10 min/suckling<sup>1</sup>:
  - Varies with apetite, etc.<sup>3</sup>
- Weaning at 7-14 months<sup>4</sup>

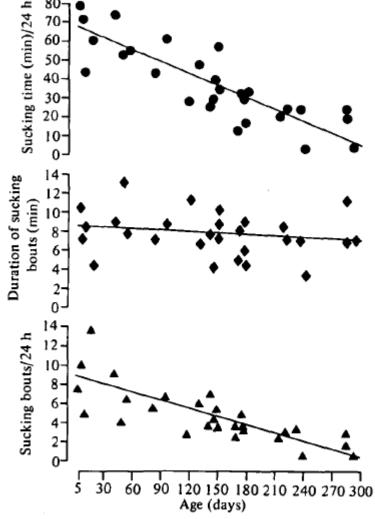

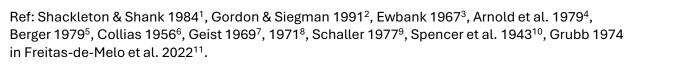

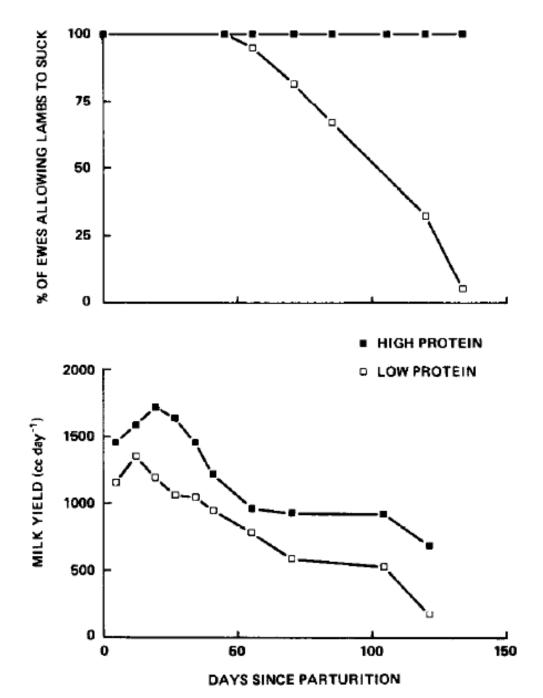

Fig. 2. Relationship between sucking performance and age in zebu calves; combined data of two 24-h observations.

# Ewe-lamb natural suckling and weaning

- Suckling bouts: 1/hour<sup>1</sup>
- Time/bout: 10-30 sec
- Bouts and time/bout decrease with age<sup>2,3</sup>
- Weaning 4-6 months<sup>4,5,6,7,8,9,10</sup>, up to 12 months<sup>11</sup>
- E.g. variation according to feed access<sup>4</sup>

## Sow-piglets natural suckling and weaning

- Fixed teat order
- 5-8 min/suckling<sup>2</sup>
- Older studies:
  - Weaning 8-22 weeks<sup>3,4,5,6</sup>
- New study:
  - 1,5 suckling/hour week 1<sup>7</sup>
  - No weaning week 11, still 0,5 suckling/hour

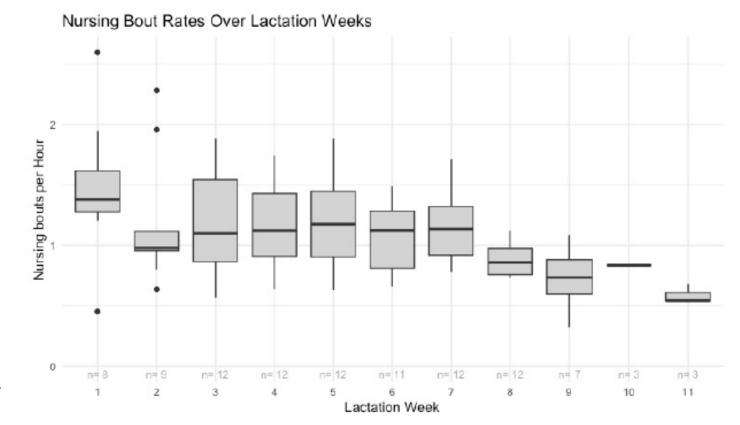

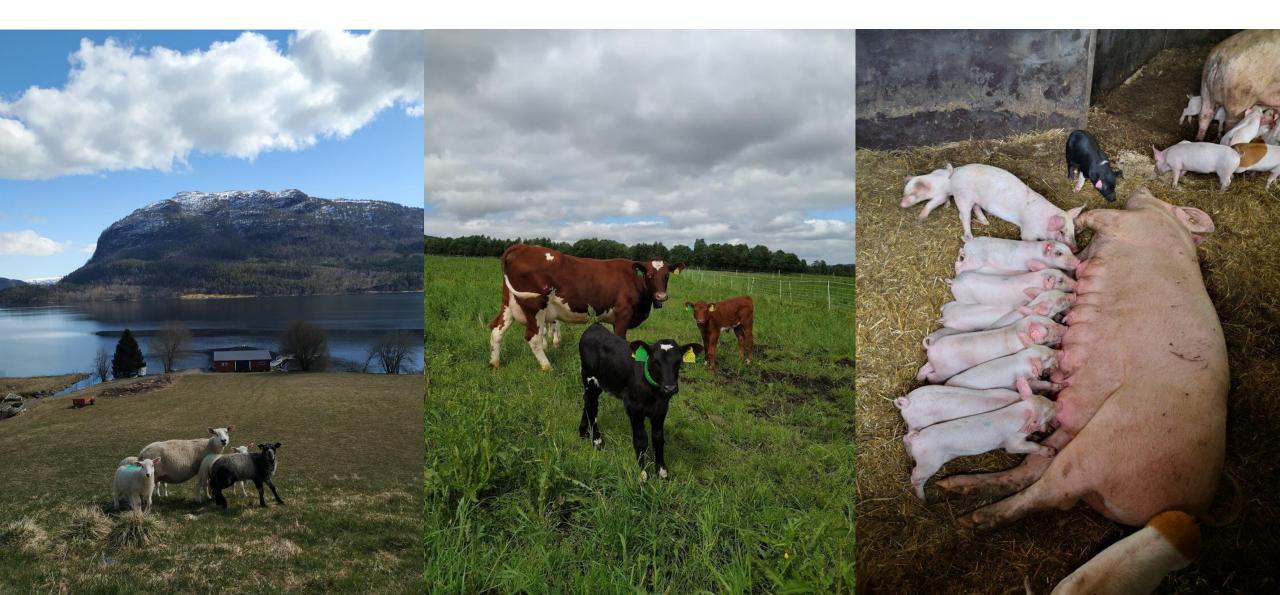

Figure 2. Boxplots of daily averaged nursing bout rates per sow within each lactation week.

The number of sows (n) is represented within each lactation week.

Ref: Keeling et al. 2001<sup>1</sup>, Moreira et al. 2020<sup>2</sup>, Newberry & Wood-Gush 1985<sup>3</sup>, Jensen 1986<sup>4</sup> Jensen & Recén 1989<sup>5</sup>, Jensen & Stangel 1992<sup>6</sup>, Markvardsen 2024<sup>7</sup>.

### Livestock management – Weaning practices

## Cattle farming – Weaning practice

#### • Dairy cow-calf:

- Early separation Deliver milk<sup>1</sup>, decrease stress response<sup>1,2</sup>
- Norwegian survey: 3% practiced CCC and 15% wished or planned for CCC<sup>3</sup>
- Weaning after 2-3 months<sup>4</sup>
- Beef cow-calf
  - Weaning and separation after 5-8 months<sup>5</sup>

Ref: Flower & Weary 2001<sup>1</sup>, Stehulova et al. 2008<sup>2</sup>, Hansen et al. 2022<sup>3</sup>, Johanssen et al. 2023<sup>4</sup>, Geno<sup>5</sup>.

## Sheep farming – Weaning practice

- Meat producion
- Ewes and lambs on pasture
- Weaning 4-7 months<sup>1</sup>
- 9% bottle-fed lambs at the farm
  - Weaned from 1 month<sup>2</sup>

#### Slakteresultater på lam, gruppert på alder ved slakt

Alder, dager	Antall slakt	Tilvekst fødsel- slakt, g/dag	Slaktevekt, kg	Klasse	Fettgruppe	Slakteverdi, kr
< 101	4 633	210	16,5	8,7 (R+)	6,3 (2+)	920
101-120	19 910	156	20,2	8,7 (R+)	5,8 (2+)	1152
121 130	<del>39 381</del>	144	20,7	8,6 (R+)	5,8 (2+)	1152
131-140	70 724	134	20,6	8,5 (R+)	5,8 (2+)	1125
141-150	83 837	123	20,3	8,4 (R)	5,9 (2+)	1086
151-160	76 896	111	19,6	8,2 (R)	5,9 (2+)	1024
161-170	65 793	100	18,8	8,1 (R)	5,8 (2+)	967
171-250	139 649	83	17,8	7,9 (R)	5,9 (2+)	900
> 250	1 487	64	18,8	7,8 (R)	6,1 (2+)	578
Gj.snitt	502 310	109	19,3	8,2 (R)	5,9 (2+)	1019

Ref: Animalia 2024<sup>1</sup>, Todnem 2019<sup>2</sup>.

## Pig farming – Weaning practice

- Conventional: Weaning from 28 days<sup>2</sup>
- Organic: Weaning from 40 days<sup>3</sup>
- Average weaning age: 33.2 days <sup>1</sup>
- Large litters Some are separated earlier
  Fed milk replacement<sup>2</sup>

Landsresultater ————————————————————————————————————										
	2018	2019	2020	2021	2022					
Antall besetninger	340	332	324	312	299					
Antall årspurker per besetning	117	115	115	117	116					
Antall kull per besetning	252	250	251	257	254					
Beregna avvente per årspurke	27,1	27,9	28,4	28,9	29,5					
Kull per årspurke	2,19	2,20	2,21	2,22	2,23					
Levendefødt per kull	14,1	14,5	14,6	14,8	14,9					
Dødfødt per kull	1,1	1,1	1,1	1,1	1,1					
Totalfødt per kull	15,2	15,7	15,7	15,9	16,0					
Avvent per kull	12,3	12,7	12,8	13,0	13,1					
Dødfødte av totalfødte, %	7,0	7,1	7,0	7,1	6,9					
Døde til avvenning, %	12,5	12,7	12,2	12,2	12,0					
Totaldødelighet, %	18,6	18,9	18,3	18,4	18,0					
Diegivingstid	33,3	33,5	33,4	33,2	33,2					
Prosent 1. kull	37,8	36,1	36,9	36,6	35,8					
Dager fra avvenning til bedekning	6,0	6,1	5,9	5,9	5,8					

## Livestock management practice

- Often abrupt and permanent separation, earlier than natural<sup>1</sup>
- Ensure reproductive performance
- Consequences:
  - Stress<sup>2,3</sup>
  - Abnormal behavior<sup>2,3</sup>
  - Solid feed intake<sup>4</sup>
  - Reduced learning transfer related to survival<sup>5</sup> (e.g. learning about grazing, predators, social learning<sup>6</sup>)

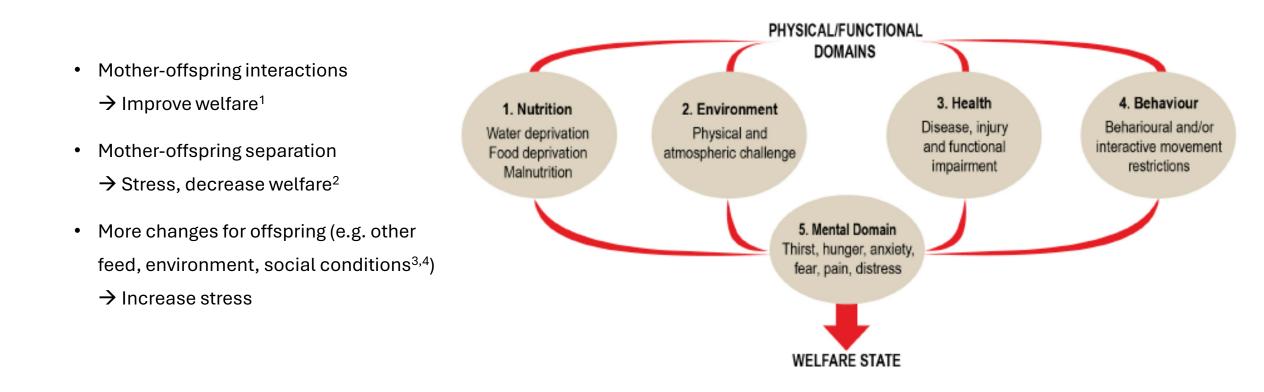

### some pigs persistently show this 'belly nosing' behaviour

## Weaning practice: – Effects on offspring's behavior and welfare – How to improve their welfare?

### Stress around weaning and separation

Ref. Mellor 2015<sup>1</sup>, Orihuela 2021<sup>2</sup>, Enriquez et al. 2011<sup>3</sup>, Freitas-de-Melo et al. 2022<sup>4</sup>, Mellor et al. 2020 (figure)

# How to reduce stress around separation and weaning?

- Ensure maternal care<sup>1</sup>  $\rightarrow$  Learning<sup>2</sup>
- Suitable environment<sup>3</sup>
- Postponement of separation<sup>1</sup>
- Separation and weaning at different times
- Gradual separation and weaning
  - Varying results on stress<sup>4</sup>
- Stimuli substitutes<sup>1</sup>
- Gradual intro to something new
  - (e.g. feed, other animals<sup>5</sup>)

Ref: Newberry & Swanson 2008<sup>1</sup>, Champagne 2008<sup>2</sup>, Rørvang et al. 2018<sup>3</sup>, Enriquez et al. 2011<sup>4</sup> Weary 2007<sup>5</sup>.

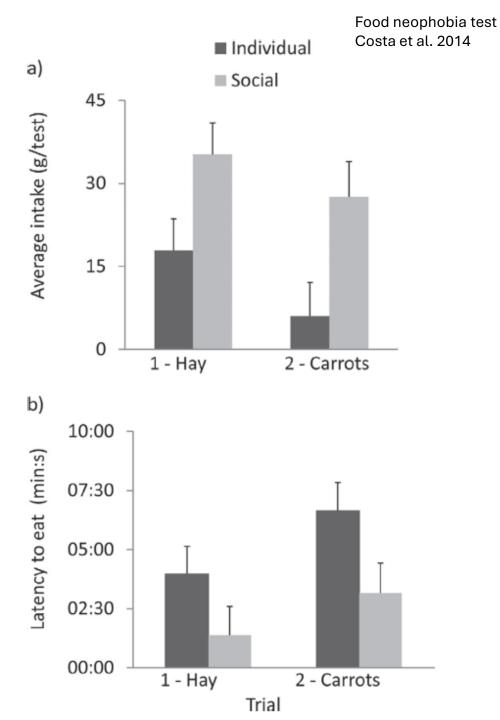

## Calf behavior and welfare

- CCC dairy calves:
  - Safety, reduced fearfulness<sup>1</sup>
  - Improved social behavior<sup>2</sup>
  - Reduced abnormal behavior
  - Reduced stress responses
- Less fearful and better coping skills:
  - Novel situations<sup>3</sup>
  - Unfamiliar calves<sup>4,5,6</sup>
  - Novel feed<sup>7</sup>
- Other factors also affect calf learning:

- Genes<sup>8</sup>, individual variations<sup>9,10</sup>, feed<sup>11</sup>, isolation<sup>12,13</sup>

• Calf-calf learning also important<sup>14,15</sup>

Ref. Green 1992<sup>1</sup>, Meagher et al. 2019<sup>2</sup>, Stehulova et al. 2008<sup>3</sup>, Flower & Weary 2001<sup>4</sup>, Wagner et al. 2013<sup>5</sup>, Krohn et al. 1999<sup>6</sup>, Costa et al. 2014<sup>7</sup>, Lauber et al. 2009<sup>8</sup>, Webb et al. 2015<sup>9</sup>, Horvath & Miller-Cushon 2018<sup>10</sup>, Horvath et al. 2016<sup>11</sup>, Costa et al. 2016<sup>12</sup>, Gaillard et al. 2014<sup>13</sup>, Vitale et al. 1986<sup>14</sup>, Cantor et al. 2019<sup>15</sup>.

## Calf behavior and welfare

- Factors affects calf behavior:
  - E.g. nutrition, housing system<sup>1</sup>
- Common practice:
  - Individual calf rearing<sup>1,2</sup>
  - Restricted milk allowance
- Natural behavior increased by:
  - Ad libitum milk feeding
  - Social calf rearing (e.g. more play)<sup>3</sup>
  - Early access to roughage2

Ref: Nikkhah & Alimirzaei 2023<sup>1</sup>, Miller-Cushon & DeVries 2015<sup>2</sup>, Krachun et al. 2010<sup>3</sup>.

## Lamb behavior and welfare

- Ewe-lamb contact:
  - Several months, natural behavior
- Weaning and separation:
  - Before natural weaning
  - Stress response
- Outfield pasture (utmark):
  - Challenge with lamb mortality<sup>1</sup>
  - Importance of ewe and lamb being together<sup>2</sup>
- Bottle-fed lambs on farm:
  - Taken care of by farmer
  - Outfield pasture later May be problematic<sup>3,4</sup>

Ref: Animalia 2024<sup>1</sup>, Nornes 2019<sup>2</sup>, Matthews & Kilgour 1979 in Napolitano et al. 2008<sup>3</sup>, Squires 1975<sup>4</sup>.

## Piglet behavior and welfare

- Nest building is important:
  - Provide straw and free movements<sup>1</sup>
- Farrowing crate:
  - Decrease sow crushing piglets<sup>2</sup>
  - Prevents maternal behavior and thus increase mortality by other factors
- Farrowing pen:
  - Increase maternal behavior<sup>3,4</sup>

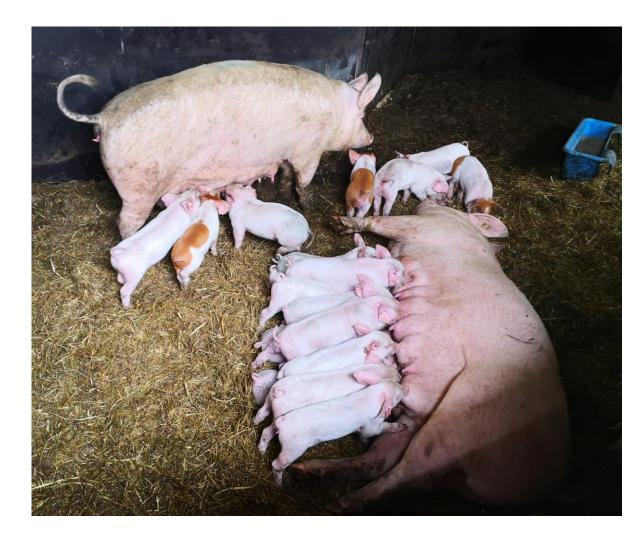

Ref: Rosvold et al. 2018<sup>1</sup>, Yun & Valros 2015, Sánchez-Salcedo & Yáñez-Pizaña 2022, Portele et al. 2019,

## Piglet behavior and welfare

- Pen or group system:
  - Increase natural behavior (e.g. play, feeding
  - behavior, social skills)<sup>2,3,4,5</sup>
  - Increase feed intake<sup>2,5</sup>
  - Decrease abnormal behavior<sup>2,5</sup>
  - Decrease injuries<sup>2,3</sup>
- Being with others before weaning<sup>1,4,7,8,4,9</sup>
- Enrichments Positive effects<sup>10</sup>
  - Before and after weaning<sup>4,5</sup>

Nieuwamerongen 2014<sup>1</sup>, 2015<sup>2</sup>, Martin et al. 2015<sup>3</sup>, Lucas et al. 2023<sup>4</sup>, Oostindjer et al. 2014<sup>5</sup>, Keeling et al. 2001<sup>6</sup>, Wenbo et al. 2021<sup>7</sup>, Weller et al. 2020<sup>8</sup>, Van Kerchaver et al. 2023<sup>9</sup>, Van Heukelom et al. 2012<sup>10</sup>.

## Human-animal interactions

- Animal welfare Behavioral interactions:
  - Importance of human-animal interactions<sup>1,2,3</sup>
- Companionship, safety:
  - Rewarding, calming effect<sup>4</sup>
  - Positive for offspring separated from their mothers<sup>6,7</sup>
- Lambs separated from mother:
  - Formed strong attachment to humans<sup>5,</sup>
- Positive human-pig interactions:
  - Reduced fear<sup>8</sup> and stress<sup>9</sup>
- Importance of farmers wellbeing and attitudes<sup>10,12</sup>:
  - Pig farmers expressed joy working Confident pigs<sup>11</sup>
  - Negative attitudes Negative moods in calves<sup>3</sup>

Ref: Mellor et al. 2020<sup>1</sup>, Mota-Rojas et al. 2020<sup>2</sup>, Ellingsen et al. 2014<sup>3</sup> Keeling et al. 2001<sup>4</sup>, Nowak & Boivin 2015<sup>5</sup>, Destrez et al. 2014<sup>6</sup>, Freitas-de-Melo et al. 2022<sup>7</sup>, Hayes 2021<sup>8</sup>, Lucas et al. 2023<sup>9</sup>, Kauppinen et al. 2015<sup>10</sup>, Pol et al. 2021<sup>11</sup>, Boyer des Roches et al. 2016<sup>12</sup>.

## Final thoughts and considerations

- Welfare by mother-offspring interactions
- Welfare by other factors
- Positive interactions with others

#### • More research?

- Increase welfare around weaning and separation
- Being with mother vs being with others and having a satisfying environment and feeding
  - What does the difference mean for the offspring's welfare?

## Thank you for listening 😳
